29 <http://www.ietf.org/shadow.html>.

30  
31 Abstract

32 This document is one of a set of documents, which together describe all aspects of a new Internet Printing  
33 Protocol (IPP). IPP is an application level protocol that can be used for distributed printing using Internet  
34 tools and technologies. This document describes a simplified model consisting of abstract objects, their  
35 attributes, and their operations that is independent of encoding and transport. The model consists of a  
36 Printer and a Job object. A Job optionally supports multiple documents. IPP ~~1.0~~[1.1](#) semantics allow end-  
37 users and operators to query printer capabilities, submit print jobs, inquire about the status of print jobs and  
38 printers, [cancel, hold, and cancel](#)~~release, and restart~~ print jobs. [IPP 1.1 semantics allow operators to pause,](#)

39 resume, and purge (jobs from) Printer objects. This document also addresses security, internationalization,  
40 and directory issues.

41 The full set of IPP documents includes:

- 42 Design Goals for an Internet Printing Protocol [~~IPP-REQ~~][RFC2567]  
43 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [~~IPP-~~  
44 ~~RAT~~][RFC2568]  
45 Internet Printing ~~Protocol/1.0:Protocol/1.1:~~ Model and Semantics (this document)  
46 Internet Printing ~~Protocol/1.0:Protocol/1.1:~~ Encoding and Transport [IPP-PRO]  
47 Internet Printing ~~Protocol/1.0:Protocol/1.1:~~ Implementer's Guide [IPP-IIG]  
48 Mapping between LPD and IPP Protocols [~~IPP-LPD~~][RFC2569]  
49

50 The "Design Goals for an Internet Printing Protocol" document takes a broad look at distributed printing  
51 functionality, and it enumerates real-life scenarios that help to clarify the features that need to be included  
52 in a printing protocol for the Internet. It identifies requirements for three types of users: end users,  
53 operators, and administrators. It calls out a subset of end user requirements that are satisfied in IPP/1.0.  
54 ~~Operator and administrator requirements are out of scope for version 1.0.~~ A few OPTIONAL operator  
55 operations have been added to IPP/1.1.

56 The "Rationale for the Structure and Model and Protocol for the Internet Printing Protocol" document  
57 describes IPP from a high level view, defines a roadmap for the various documents that form the suite of  
58 IPP specification documents, and gives background and rationale for the IETF working group's major  
59 decisions.

60 The "Internet Printing ~~Protocol/1.0:Protocol/1.1:~~ Encoding and Transport" document is a formal mapping  
61 of the abstract operations and attributes defined in the model document onto HTTP/1.1 [RFC2616]. It  
62 defines the encoding rules for a new Internet MIME media type called "application/ipp". This document  
63 also defines the rules for transporting over HTTP a message body whose Content-Type is "application/ipp".  
64 This document defines a new scheme named 'ipp' for identifying IPP printers and jobs.

65 The "Internet Printing ~~Protocol/1.0:Protocol/1.1:~~ Implementer's Guide" document gives insight and advice  
66 to implementers of IPP clients and IPP objects. It is intended to help them understand ~~IPP/1.0~~IPP/1.1 and  
67 some of the considerations that may assist them in the design of their client and/or IPP object  
68 implementations. For example, a typical order of processing requests is given, including error checking.  
69 Motivation for some of the specification decisions is also included.

70 The "Mapping between LPD and IPP Protocols" document gives some advice to implementers of gateways  
71 between IPP and LPD (Line Printer Daemon) implementations.

72

## Table of Contents

73	1. Introduction .....	11
74	1.1 Simplified Printing Model .....	12
75	2. IPP Objects .....	14
76	2.1 Printer Object .....	14
77	2.2 Job Object .....	17
78	2.3 Object Relationships .....	18
79	2.4 Object Identity .....	19
80	3. IPP Operations .....	21
81	3.1 Common Semantics .....	22
82	3.1.1 Required Parameters .....	22
83	3.1.2 Operation IDs and Request IDs .....	23
84	3.1.3 Attributes .....	23
85	3.1.4 Character Set and Natural Language Operation Attributes .....	24
86	3.1.4.1 Request Operation Attributes .....	25
87	3.1.4.2 Response Operation Attributes .....	28
88	3.1.5 Operation Targets .....	28
89	3.1.6 Operation Response Status Codes and Status Messages .....	30
90	3.1.6.1 "status-code" (type2 enum) .....	30
91	3.1.6.2 "status-message" (text(255)) .....	31
92	3.1.6.3 "detailed-status-message" (text(MAX)) .....	31
93	3.1.6.4 "document-access-error" (text(MAX)) .....	31
94	3.1.7 Unsupported Attributes .....	32
95	3.1.8 Versions .....	33
96	3.1.9 Job Creation Operations .....	35
97	3.2 Printer Operations .....	37
98	3.2.1 Print-Job Operation .....	37
99	3.2.1.1 Print-Job Request .....	37
100	3.2.1.2 Print-Job Response .....	41
101	3.2.2 Print-URI Operation .....	43
102	3.2.3 Validate-Job Operation .....	43
103	3.2.4 Create-Job Operation .....	44
104	3.2.5 Get-Printer-Attributes Operation .....	44
105	3.2.5.1 Get-Printer-Attributes Request .....	45
106	3.2.5.2 Get-Printer-Attributes Response .....	47
107	3.2.6 Get-Jobs Operation .....	47
108	3.2.6.1 Get-Jobs Request .....	48
109	3.2.6.2 Get-Jobs Response .....	49
110	3.2.7 Pause-Printer Operation .....	50
111	3.2.7.1 Pause-Printer Request .....	51
112	3.2.7.2 Pause-Printer Response .....	52
113	3.2.8 Resume-Printer Operation .....	52

114	3.2.9	Purge-Jobs Operation.....	53
115	3.3	Job Operations .....	54
116	3.3.1	Send-Document Operation.....	54
117	3.3.1.1	Send-Document Request .....	55
118	3.3.1.2	Send-Document Response.....	56
119	3.3.2	Send-URI Operation .....	57
120	3.3.3	Cancel-Job Operation.....	57
121	3.3.3.1	Cancel-Job Request .....	58
122	3.3.3.2	Cancel-Job Response.....	59
123	3.3.4	Get-Job-Attributes Operation.....	60
124	3.3.4.1	Get-Job-Attributes Request .....	60
125	3.3.4.2	Get-Job-Attributes Response.....	61
126	3.3.5	Hold-Job Operation.....	62
127	3.3.5.1	Hold-Job Request .....	63
128	3.3.5.2	Hold-Job Response.....	63
129	3.3.6	Release-Job Operation .....	63
130	3.3.7	Restart-Job Operation .....	64
131	3.3.7.1	Restart-Job Request.....	65
132	3.3.7.2	Restart-Job Response .....	66
133	4.	Object Attributes .....	66
134	4.1	Attribute Syntaxes.....	67
135	4.1.1	'text'.....	67
136	4.1.1.1	'textWithoutLanguage'.....	68
137	4.1.1.2	'textWithLanguage'.....	68
138	4.1.2	'name'.....	69
139	4.1.2.1	'nameWithoutLanguage'.....	69
140	4.1.2.2	'nameWithLanguage' .....	69
141	4.1.2.3	Matching 'name' attribute values .....	70
142	4.1.3	'keyword' .....	70
143	4.1.4	'enum' .....	71
144	4.1.5	'uri'.....	72
145	4.1.6	'uriScheme' .....	72
146	4.1.7	'charset'.....	72
147	4.1.8	'naturalLanguage'.....	73
148	4.1.9	'mimeType'.....	73
149	4.1.9.1	Application/octet-stream -- Auto-Sensing the document format .....	74
150	4.1.10	'octetString'.....	75
151	4.1.11	'boolean'.....	75
152	4.1.12	'integer' .....	75
153	4.1.13	'rangeOfInteger' .....	75
154	4.1.14	'dateTime' .....	75
155	4.1.15	'resolution'.....	75
156	4.1.16	'1setOf X'.....	76
157	4.2	Job Template Attributes.....	76

158	4.2.1	job-priority (integer(1:100)).....	79
159	4.2.2	job-hold-until (type3 keyword   name (MAX)).....	80
160	4.2.3	job-sheets (type3 keyword   name(MAX)).....	80
161	4.2.4	multiple-document-handling (type2 keyword).....	81
162	4.2.5	copies (integer(1:MAX)).....	82
163	4.2.6	finishings (1setOf type2 enum).....	82
164	4.2.7	page-ranges (1setOf rangeOfInteger (1:MAX)).....	84
165	4.2.8	sides (type2 keyword).....	85
166	4.2.9	number-up (integer(1:MAX)).....	85
167	4.2.10	orientation-requested (type2 enum).....	86
168	4.2.11	media (type3 keyword   name(MAX)).....	87
169	4.2.12	printer-resolution (resolution).....	87

350 1. Introduction

351 The Internet Printing Protocol (IPP) is an application level protocol that can be used for distributed printing  
352 using Internet tools and technologies. IPP version ~~1.0 (IPP/1.0)~~ 1.1 (IPP/1.1) focuses only on end user  
353 functionality. This document is just one of a suite of documents that fully define IPP. The full set of IPP  
354 documents includes:

- 355 Design Goals for an Internet Printing Protocol [~~IPP-REQ~~][RFC2567]
- 356 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [~~IPP-~~  
357 ~~RAT~~][RFC2568]
- 358 Internet Printing ~~Protocol/1.0:~~Protocol/1.1: Model and Semantics (this document)
- 359 Internet Printing ~~Protocol/1.0:~~Protocol/1.1: Encoding and Transport [IPP-PRO]
- 360 Internet Printing ~~Protocol/1.0:~~Protocol/1.1: Implementer's Guide [IPP-IIG]
- 361 Mapping between LPD and IPP Protocols [~~IPP-LPD~~][RFC2569]

363 Anyone reading these documents for the first time is strongly encouraged to read the IPP documents in the  
364 above order.

365 This document is laid out as follows:

- 366 - The rest of Section 1 is an introduction to the IPP simplified model for distributed printing.
- 367 - Section 2 introduces the object types covered in the model with their basic behaviors, attributes, and  
368 interactions.
- 369 - Section 3 defines the operations included in ~~IPP/1.0:~~IPP/1.1: IPP operations are synchronous,  
370 therefore, for each operation, there is a both request and a response.
- 371 - Section 4 defines the attributes (and their syntaxes) that are used in the model.
- 372 - Sections 5 - 6 summarizes the implementation conformance requirements for objects that support the  
373 protocol and IANA considerations, respectively.
- 374 - Sections 7 - ~~12~~11 cover the Internationalization and Security considerations as well as  
375 References, Copyright Notice, Author contact information, and Formats for Registration Proposals.
- 376 - Sections ~~13-15~~12 - 14 are appendices that cover Terminology, Status Codes and Messages, and  
377 "media" keyword values.

378 Note: This document uses terms such as "attributes", "keywords", and "support". These  
379 terms have special meaning and are defined in the model terminology section 12.2.  
380 Capitalized terms, such as MUST, MUST NOT, REQUIRED, SHOULD, SHOULD NOT,  
381 MAY, NEED NOT, and OPTIONAL, have special meaning relating to conformance. These  
382 terms are defined in section 12.1 on conformance terminology, most of which is taken from  
383 RFC 2119 [RFC2119].

- 384 - Section ~~16~~15 is an appendix that helps to clarify the effects of interactions between related attributes  
385 and their values.
- 386 - Section ~~17~~16 is an appendix that enumerates the subset of Printer attributes that form a generic  
387 directory schema. These attributes are useful when registering a Printer so that a client can find the  
388 Printer not just by name, but by filtered searches as well.
- 389 - Section ~~18 is an appendix that provides a Change History summarizing the clarification and changes~~  
390 ~~that might affect an implementation since the June 30, 1998 draft.~~ 17 is an appendix summarizing

391 the additions and changes from the IPP/1.0 "Model and Semantics" document [RFC2566] to make  
392 this IPP/1.1 document.  
393 - Section 18 is the full copyright notice.

## 394 1.1 Simplified Printing Model

395 In order to achieve its goal of realizing a workable printing protocol for the Internet, the Internet Printing  
396 Protocol (IPP) is based on a simplified printing model that abstracts the many components of real world  
397 printing solutions. The Internet is a distributed computing environment where requesters of print services  
398 (clients, applications, printer drivers, etc.) cooperate and interact with print service providers. This model  
399 and semantics document describes a simple, abstract model for IPP even though the underlying  
400 configurations may be complex "n-tier" client/server systems. An important simplifying step in the IPP  
401 model is to expose only the key objects and interfaces required for printing. The model described in this  
402 model document does not include features, interfaces, and relationships that are beyond the scope of the  
403 first version of IPP (~~IPP/1.0~~). ~~IPP/1.0~~(IPP/1.1). IPP/1.1 incorporates many of the relevant ideas and  
404 lessons learned from other specification and development efforts [HTPP] [ISO10175] [LDPA] [P1387.4]  
405 [PSIS] [RFC1179] [SWP]. IPP is heavily influenced by the printing model introduced in the Document  
406 Printing Application (DPA) [ISO10175] standard. Although DPA specifies both end user and  
407 administrative features, IPP version ~~1.0 (IPP/1.0) focuses only on end user functionality~~. 1.1 (IPP/1.1)  
408 focuses primarily on end user functionality with a few additional OPTIONAL operator operations.

409 The ~~IPP/1.0~~IPP/1.1 model encapsulates the important components of distributed printing into two object  
410 types:

- 411 - Printer (Section 2.1)
- 412 - Job (Section 2.2)

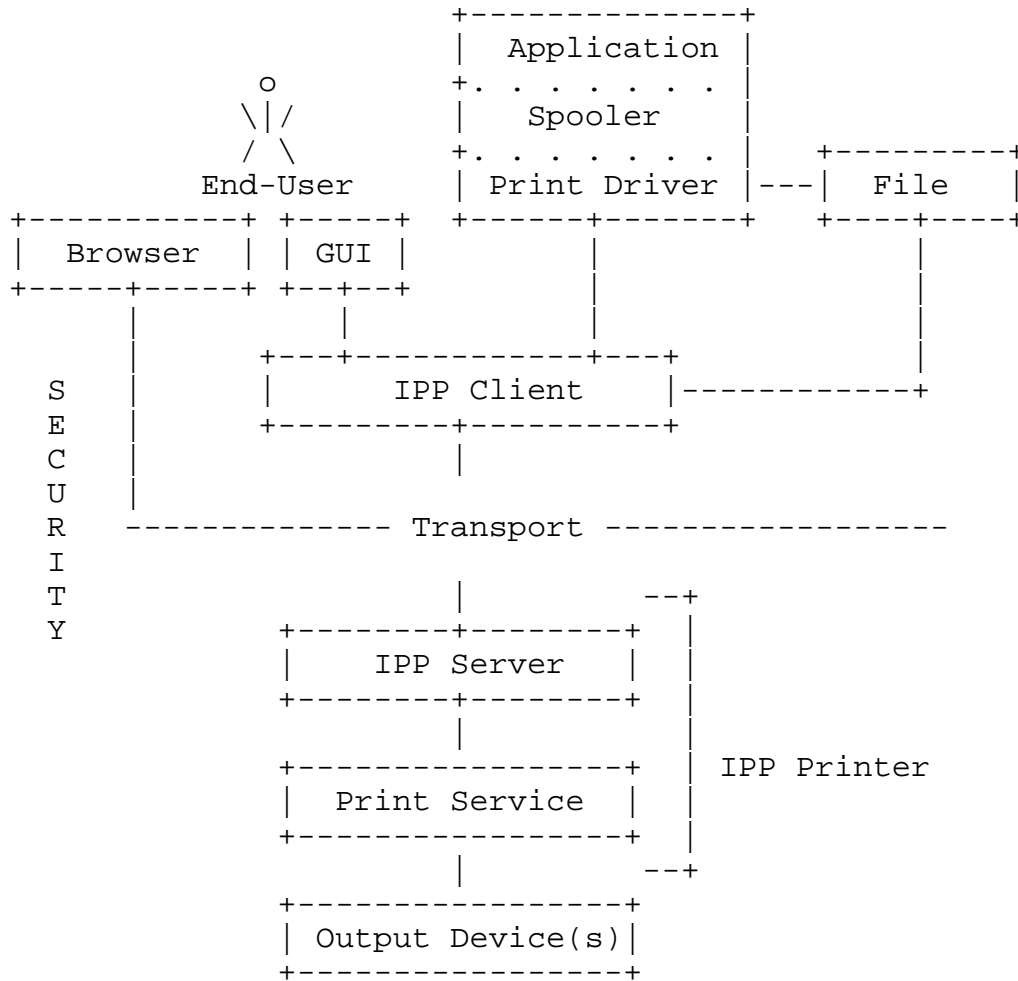

413

414 Each object type has an associated set of operations (see section 3) and attributes (see section 4).

415 It is important, however, to understand that in real system implementations (which lie underneath the  
416 abstracted ~~IPP/1.0~~IPP/1.1 model), there are other components of a print service which are not explicitly  
417 defined in the ~~IPP/1.0~~IPP/1.1 model. The following figure illustrates where ~~IPP/1.0~~IPP/1.1 fits with respect  
418 to these other components.

450 An IPP Printer object encapsulates the functions normally associated with physical output devices along  
 451 with the spooling, scheduling and multiple device management functions often associated with a print  
 452 server. Printer objects are optionally registered as entries in a directory where end users find and select them  
 453 based on some sort of filtered and context based searching mechanism (see section 16). The directory is  
 454 used to store relatively static information about the Printer, allowing end users to search for and find  
 455 Printers that match their search criteria, for example: name, context, printer capabilities, etc. The more  
 456 dynamic information, such as state, currently loaded and ready media, number of jobs at the Printer, errors,  
 457 warnings, and so forth, is directly associated with the Printer object itself rather than with the entry in the  
 458 directory which only represents the Printer object.

459 IPP clients implement the IPP protocol on the client side and give end users (or programs running on behalf  
 460 of end users) the ability to query Printer objects and submit and manage print jobs. An IPP server is just  
 461 that part of the Printer object that implements the server-side protocol. The rest of the Printer object  
 462 implements (or gateways into) the application semantics of the print service itself. The Printer objects may  
 463 be embedded in an output device or may be implemented on a host on the network that communicates with  
 464 an output device.

465 When a job is submitted to the Printer object and the Printer object validates the attributes in the  
466 submission request, the Printer object creates a new Job object. The end user then interacts with this new  
467 Job object to query its status and monitor the progress of the job. ~~End users may also cancel the print~~  
468 ~~job~~An end user can also cancel their print jobs by using the Job object's Cancel-Job operation. An end-user  
469 can also hold, release, and restart their print jobs using the Job object's OPTIONAL Hold-Job, Release-Job,  
470 and Restart-Job operations, if implemented.

471 A privileged operator or administrator of a Printer object can cancel, hold, release, and restart any user's job  
472 using the REQUIRED Cancel-Job and the OPTIONAL Hold-Job, Release-Job, and Restart-Job operations.  
473 In additional privileged operator or administrator of a Printer object can pause, resume, or purge (jobs from)  
474 a Printer object using the OPTIONAL Pause-Printer, Resume-Printer, and Purge-Jobs operations, if  
475 implemented.

476 The notification service is out of scope for ~~IPP/1.0~~this IPP/1.1 document, but using such a notification  
477 service, the end user is able to register for and receive Printer specific and Job specific events. An end user  
478 can query the status of Printer objects and can follow the progress of Job objects by polling using the Get-  
479 ~~Printer-Attributes, Printer-Attributes,~~Get-Jobs, and Get-Job-Attributes operations.

## 480 2. IPP Objects

481 The ~~IPP/1.0~~IPP/1.1 model introduces objects of type Printer and Job. Each type of object models relevant  
482 aspects of a real-world entity such as a real printer or real print job. Each object type is defined as a set of  
483 possible attributes that may be supported by instances of that object type. For each object (instance), the  
484 actual set of supported attributes and values describe a specific implementation. The object's attributes and  
485 values describe its state, capabilities, realizable features, job processing functions, and default behaviors  
486 and characteristics. For example, the Printer object type is defined as a set of attributes that each Printer  
487 object potentially supports. In the same manner, the Job object type is defined as a set of attributes that are  
488 potentially supported by each Job object.

489 Each attribute included in the set of attributes defining an object type is labeled as:

- 490 - "REQUIRED": each object MUST support the attribute.
- 491 - "RECOMMENDED": each object SHOULD support the attribute.
- 492 - "OPTIONAL": each object MAY support the attribute.

493  
494 ~~There is no such similar labeling~~Some definitions of attribute values indicate that an object MUST or  
495 SHOULD support the value; otherwise, support of the value is OPTIONAL. However, if an  
496 implementation supports an attribute, it MUST support at least one of the possible values for that attribute.

### 497 2.1 Printer Object

498 The major component of the ~~IPP/1.0~~IPP/1.1 model is the Printer object. A Printer object implements the  
499 server-side of the ~~IPP/1.0~~IPP/1.1 protocol. Using the protocol, end users may query the attributes of the

500 Printer object and submit print jobs to the Printer object. The actual implementation components behind  
501 the Printer abstraction may take on different forms and different configurations. However, the model  
502 abstraction allows the details of the configuration of real components to remain opaque to the end user.  
503 Section 3 describes each of the Printer operations in detail.

504 The capabilities and state of a Printer object are described by its attributes. Printer attributes are divided  
505 into two groups:

- 506 - "job-template" attributes: These attributes describe supported job processing capabilities and defaults  
507 for the Printer object. (See section 4.2)
- 508 - "printer-description" attributes: These attributes describe the Printer object's identification, state,  
509 location, references to other sources of information about the Printer object, etc. (see section 4.4)

511 Since a Printer object is an abstraction of a generic document output device and print service provider, a  
512 Printer object could be used to represent any real or virtual device with semantics consistent with the  
513 Printer object, such as a fax device, an imager, or even a CD writer.

514 Some examples of configurations supporting a Printer object include:

- 515 1) An output device with no spooling capabilities
- 516 2) An output device with a built-in spooler
- 517 3) A print server supporting IPP with one or more associated output devices
  - 518 3a) The associated output devices may or may not be capable of spooling jobs
  - 519 3b) The associated output devices may or may not support IPP

521 The following figures show some examples of how Printer objects can be realized on top of various  
522 distributed printing configurations. The embedded case below represents configurations 1 and 2. The  
523 hosted and fan-out figures below represent configurations 3a and 3b.

524 In this document the term "client" refers to a software entity that sends IPP operation requests to an IPP  
525 Printer object and accepts IPP operation responses. A client MAY be:

- 526 1. contained within software controlled by an end user, e.g. activated by the "Print" menu item in an  
527 application or
- 528 2. the print server component that sends IPP requests to either an output device or another  
529 "downstream" print server.

530 The term "IPP Printer" is a network entity that accepts IPP operation requests and returns IPP operation  
531 responses. As such, an IPP object MAY be:

- 532 1. an (embedded) device component that accepts IPP requests and controls the device or
- 533 2. a component of a print server that accepts IPP requests (where the print server controls one or more  
534 networked devices using IPP or other protocols).

536 Legend:

537

538 ##### indicates a Printer object which is  
539 either embedded in an output device or is  
540 hosted in a server. The Printer object  
541 might or might not be capable of queuing/spooling.

542

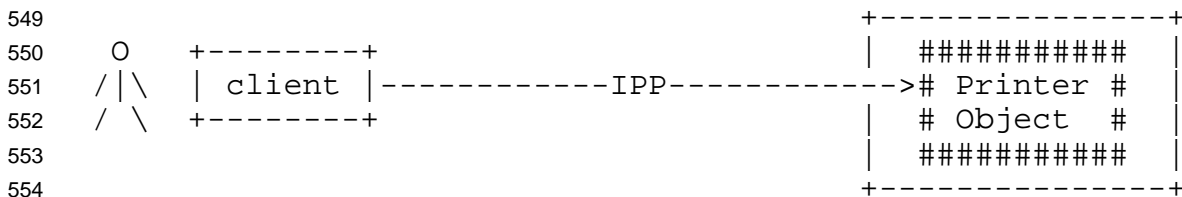

543 any indicates any network protocol or direct  
544 connect, including IPP

566

578

## 579 2.2 Job Object

580 A Job object is used to model a print job. A Job object contains documents. The information required to  
581 create a Job object is sent in a create request from the end user via an IPP Client to the Printer object. The

582 Printer object validates the create request, and if the Printer object accepts the request, the Printer object  
583 creates the new Job object. Section 3 describes each of the Job operations in detail.

584 The characteristics and state of a Job object are described by its attributes. Job attributes are grouped into  
585 two groups as follows:

- 586 - "job-template" attributes: These attributes can be supplied by the client or end user and include job  
587 processing instructions which are intended to override any Printer object defaults and/or instructions  
588 embedded within the document data. (See section 4.2)
- 589 - "job-description" attributes: These attributes describe the Job object's identification, state, size, etc.  
590 The client supplies some of these attributes, and the Printer object generates others. (See section 4.3)

591

592 An implementation MUST support at least one document per Job object. An implementation MAY support  
593 multiple documents per Job object. A document is either:

- 594 - a stream of document data in a format supported by the Printer object (typically a Page Description  
595 Language - PDL), or
- 596 - a reference to such a stream of document data

597

598 In ~~IPP/1.0~~, IPP/1.1, a document is not modeled as an IPP object, therefore it has no object identifier or  
599 associated attributes. All job processing instructions are modeled as Job object attributes. These attributes  
600 are called Job Template attributes and they apply equally to all documents within a Job object.

## 601 2.3 Object Relationships

602 IPP objects have relationships that are maintained persistently along with the persistent storage of the object  
603 attributes.

604 A Printer object can represent either one or more physical output devices or a logical device which  
605 "processes" jobs but never actually uses a physical output device to put marks on paper. Examples of  
606 logical devices include a Web page publisher or a gateway into an online document archive or repository.  
607 A Printer object contains zero or more Job objects.

608 A Job object is contained by exactly one Printer object, however the identical document data associated  
609 with a Job object could be sent to either the same or a different Printer object. In this case, a second Job  
610 object would be created which would be almost identical to the first Job object, however it would have new  
611 (different) Job object identifiers (see section 2.4).

612 A Job object is either empty (before any documents have been added) or contains one or more documents.  
613 If the contained document is a stream of document data, that stream can be contained in only one document.  
614 However, there can be identical copies of the stream in other documents in the same or different Job  
615 objects. If the contained document is just a reference to a stream of document data, other documents (in the  
616 same or different Job object(s)) may contain the same reference.

617 2.4 Object Identity

618 All Printer and Job objects are identified by a Uniform Resource Identifier (URI) [RFC2396] so that they  
619 can be persistently and unambiguously referenced. The notion of a URI is a useful concept, however, until  
620 the notion of URI is more stable (i.e., defined more completely and deployed more widely), it is expected  
621 that the URIs used for IPP objects will actually be URLs [RFC2396]. Since every URL is a specialized  
622 form of a URI, even though the more generic term URI is used throughout the rest of this document, its  
623 usage is intended to cover the more specific notion of URL as well.

624 An administrator configures Printer objects to either support or not support authentication and/or message  
625 privacy using ~~SSL3 [SSL]~~ Transport Layer Security (TLS) [RFC2246] (the mechanism for security  
626 configuration is outside the scope of ~~IPP/1.0~~ this IPP/1.1 document). In some situations, both types of  
627 connections (both authenticated and unauthenticated) can be established using a single communication  
628 channel that has some sort of negotiation mechanism. In other situations, multiple communication channels  
629 are used, one for each type of security configuration. Section 8 provides a full description of all security  
630 considerations and configurations.

631 If a Printer object supports more than one communication channel, some or all of those channels might  
632 support and/or require different security mechanisms. In such cases, an administrator could expose the  
633 simultaneous support for these multiple communication channels as multiple URIs for a single Printer  
634 object where each URI represents one of the communication channels to the Printer object. To support this  
635 flexibility, the IPP Printer object type defines a multi-valued identification attribute called the "printer-uri-  
636 supported" attribute. It MUST contain at least one URI. It MAY contain more than one URI. That is,  
637 every Printer object will have at least one URI that identifies at least one communication channel to the  
638 Printer object, but it may have more than one URI where each URI identifies a different communication  
639 channel to the Printer object. The "printer-uri-supported" attribute has ~~at two~~ two companion attributes, the "uri-  
640 security-supported" ~~attribute and the "uri-attribute, that has~~ authentication-supported". ~~Both have~~ Both have the same  
641 cardinality as "printer-uri-supported". The purpose of the "uri-security-supported" attribute is to indicate  
642 the security mechanisms (if any) used for each URI listed in "printer-uri-supported". ~~The purpose of the~~ The purpose of the  
643 "uri-authentication-supported" attribute is to indicate the authentication mechanisms (if any) used for each  
644 URI listed in "printer-uri-supported". These ~~two~~ three attributes are fully described in sections 4.4.1 ~~and~~,  
645 4.4.2, ~~and~~ 4.4.3.

646 When a job is submitted to the Printer object via a create request, the client supplies only a single Printer  
647 object URI. The client supplied Printer object URI MUST be one of the values in the "printer-uri-  
648 supported" Printer attribute.

649 ~~Note: IPP/1.0~~ IPP/1.1 does not specify how the client obtains the client supplied URI, but it is  
650 RECOMMENDED that a Printer object be registered as an entry in a directory service. End-users and  
651 programs can then interrogate the directory searching for Printers. Section 16 defines a generic schema for  
652 Printer object entries in the directory service and describes how the entry acts as a bridge to the actual IPP  
653 Printer object. The entry in the directory that represents the IPP Printer object includes the possibly many  
654 URIs for that Printer object as values in one its attributes.

655 When a client submits a create request to the Printer object, the Printer object validates the request and  
656 creates a new Job object. The Printer object assigns the new Job object a URI which is stored in the "job-  
657 uri" Job attribute. This URI is then used by clients as the target for subsequent Job operations. The Printer  
658 object generates a Job URI based on its configured security policy and the URI used by the client in the  
659 create request.

660 For example, consider a Printer object that supports both a communication channel secured by the use of  
661 SSL3 (using HTTP over SSL3 with an "https" schemed URI) and another open communication channel that  
662 is not secured with SSL3 (using a simple "http" schemed URI). If a client were to submit a job using the  
663 secure URI, the Printer object would assign the new Job object a secure URI as well. If a client were to  
664 submit a job using the open-channel URI, the Printer would assign the new Job object an open-channel  
665 URI.

666 In addition, the Printer object also populates the Job object's "job-printer-uri" attribute. This is a reference  
667 back to the Printer object that created the Job object. If a client only has access to a Job object's "job-uri"  
668 identifier, the client can query the Job's "job-printer-uri" attribute in order to determine which Printer object  
669 created the Job object. If the Printer object supports more than one URI, the Printer object picks the one  
670 URI supplied by the client when creating the job to build the value for and to populate the Job's "job-  
671 printer-uri" attribute.

672 Allowing Job objects to have URIs allows for flexibility and scalability. For example, in some  
673 implementations, the Printer object might create Jobs that are processed in the same local environment as  
674 the Printer object itself. In this case, the Job URI might just be a composition of the Printer's URI and some  
675 unique component for the Job object, such as the unique 32-bit positive integer mentioned later in this  
676 paragraph. In other implementations, the Printer object might be a central clearing-house for validating all  
677 Job object creation requests, but the Job object itself might be created in some environment that is remote  
678 from the Printer object. In this case, the Job object's URI may have no physical-location relationship at all  
679 to the Printer object's URI. Again, the fact that Job objects have URIs allows for flexibility and scalability,  
680 however, many existing printing systems have local models or interface constraints that force print jobs to  
681 be identified using only a 32-bit positive integer rather than an independent URI. This numeric Job ID is  
682 only unique within the context of the Printer object to which the create request was originally submitted.  
683 Therefore, in order to allow both types of client access to IPP Job objects (either by Job URI or by numeric  
684 Job ID), when the Printer object successfully processes a create request and creates a new Job object, the  
685 Printer object MUST generate both a Job URI and a Job ID. The Job ID (stored in the "job-id" attribute)  
686 only has meaning in the context of the Printer object to which the create request was originally submitted.  
687 This requirement to support both Job URIs and Job IDs allows all types of clients to access Printer objects  
688 and Job objects no matter the local constraints imposed on the client implementation.

689 In addition to identifiers, Printer objects and Job objects have names ("printer-name" and "job-name"). An  
690 object name NEED NOT be unique across all instances of all objects. A Printer object's name is chosen and  
691 set by an administrator through some mechanism outside the scope of [IPP/1.0](#). [this IPP/1.1 document](#). A  
692 Job object's name is optionally chosen and supplied by the IPP client submitting the job. If the client does  
693 not supply a Job object name, the Printer object generates a name for the new Job object. In all cases, the  
694 name only has local meaning.

695 To summarize:

- 696 - Each Printer object is identified with one or more URIs. The Printer's "printer-uri-supported" attribute  
697 contains the URI(s).
- 698 - The Printer object's "uri-security-supported" attribute identifies the communication channel security  
699 protocols that may or may not have been configured for the various Printer object URIs (e.g.,  
700 'tls' 'ssl3' or 'none').
- 701 - The Printer object's "uri-authentication-supported" attribute identifies the authentication mechanisms  
702 that may or may not have been configured for the various Printer object URIs (e.g., 'digest' or  
703 'none').
- 704 - Each Job object is identified with a Job URI. The Job's "job-uri" attribute contains the URI.
- 705 - Each Job object is also identified with Job ID which is a 32-bit, positive integer. The Job's "job-id"  
706 attribute contains the Job ID. The Job ID is only unique within the context of the Printer object  
707 which created the Job object.
- 708 - Each Job object has a "job-printer-uri" attribute which contains the URI of the Printer object that was  
709 used to create the Job object. This attribute is used to determine the Printer object that created a Job  
710 object when given only the URI for the Job object. This linkage is necessary to determine the  
711 languages, charsets, and operations which are supported on that Job (the basis for such support  
712 comes from the creating Printer object).
- 713 - Each Printer object has a name (which is not necessarily unique). The administrator chooses and sets  
714 this name through some mechanism outside the scope of ~~IPP/1.0 itself~~ this IPP/1.1 document. The  
715 Printer object's "printer-name" attribute contains the name.
- 716 - Each Job object has a name (which is not necessarily unique). The client optionally supplies this name  
717 in the create request. If the client does not supply this name, the Printer object generates a name for  
718 the Job object. The Job object's "job-name" attribute contains the name.

### 719 3. IPP Operations

720 IPP objects support operations. An operation consists of a request and a response. When a client  
721 communicates with an IPP object, the client issues an operation request to the URI for that object.  
722 Operation requests and responses have parameters that identify the operation. Operations also have  
723 attributes that affect the run-time characteristics of the operation (the intended target, localization  
724 information, etc.). These operation-specific attributes are called operation attributes (as compared to object  
725 attributes such as Printer object attributes or Job object attributes). Each request carries along with it any  
726 operation attributes, object attributes, and/or document data required to perform the operation. Each  
727 request requires a response from the object. Each response indicates success or failure of the operation with  
728 a status code as a response parameter. The response contains any operation attributes, object attributes,  
729 and/or status messages generated during the execution of the operation request.

730 This section describes the semantics of the IPP operations, both requests and responses, in terms of the  
731 parameters, attributes, and other data associated with each operation.

732 The ~~IPP/1.0~~ IPP/1.1 Printer operations are:

- 733 Print-Job (section 3.2.1)
- 734 Print-URI (section 3.2.2)
- 735 Validate-Job (section 3.2.3)

- 736 Create-Job (section 3.2.4)
- 737 Get-Printer-Attributes (section 3.2.5)
- 738 Get-Jobs (section 3.2.6)
- 739 Pause-Printer (section 3.3.5)
- 740 Resume-Printer (section 3.3.6)
- 741 Purge-Jobs (section 3.3.7)
- 742

743 The Job operations are:

- 744 Send-Document (section 3.3.1)
- 745 Send-URI (section 3.3.2)
- 746 Cancel-Job (section 3.3.3)
- 747 Get-Job-Attributes (section 3.3.4)
- 748 Hold-Job (section 3.3.5)
- 749 Release-Job (section 3.3.6)
- 750 Restart-Job (section 3.3.7)
- 751

752 The Send-Document and Send-URI Job operations are used to add a new document to an existing multi-  
753 document Job object created using the Create-Job operation.

### 754 3.1 Common Semantics

755 All IPP operations require some common parameters and operation attributes. These common elements  
756 and their semantic characteristics are defined and described in more detail in the following sections.

#### 757 3.1.1 Required Parameters

758 Every operation request contains the following REQUIRED parameters:

- 759 - a "version-number",
- 760 - an "operation-id",
- 761 - a "request-id", and
- 762 - the attributes that are REQUIRED for that type of request.
- 763

764 Every operation response contains the following REQUIRED parameters:

- 765 - a "version-number",
- 766 - a "status-code",
- 767 - the "request-id" that was supplied in the corresponding request, and
- 768 - the attributes that are REQUIRED for that type of response.
- 769

770 The ~~encoding and transport~~ Encoding and Transport document [IPP-PRO] defines special rules for the  
771 encoding of these parameters. All other operation elements are represented using the more generic  
772 encoding rules for attributes and groups of attributes.

773 3.1.2 Operation IDs and Request IDs

774 Each IPP operation request includes an identifying "operation-id" value. Valid values are defined in the  
775 "operations-supported" Printer attribute section (see section 4.4.15). The client specifies which operation is  
776 being requested by supplying the correct "operation-id" value.

777 In addition, every invocation of an operation is identified by a "request-id" value. For each request, the  
778 client chooses the "request-id" which MUST be an integer (possibly unique depending on client  
779 requirements) in the range from 1 to  $2^{31} - 1$  (inclusive). This "request-id" allows clients to manage  
780 multiple outstanding requests. The receiving IPP object copies all 32-bits of the client-supplied "request-id"  
781 attribute into the response so that the client can match the response with the correct outstanding request,  
782 even if the "request-id" is out of range. If the request is terminated before the complete "request-id" is  
783 received, the IPP object rejects the request and returns a response with a "request-id" of 0.

784 Note: In some cases, the transport protocol underneath IPP might be a connection oriented protocol that  
785 would make it impossible for a client to receive responses in any order other than the order in which the  
786 corresponding requests were sent. In such cases, the "request-id" attribute would not be essential for correct  
787 protocol operation. However, in other mappings, the operation responses can come back in any order. In  
788 these cases, the "request-id" would be essential.

789 3.1.3 Attributes

790 Operation requests and responses are both composed of groups of attributes and/or document data. The  
791 attributes groups are:

- 792 - Operation Attributes: These attributes are passed in the operation and affect the IPP object's behavior  
793 while processing the operation request and may affect other attributes or groups of attributes. Some  
794 operation attributes describe the document data associated with the print job and are associated with  
795 new Job objects, however most operation attributes do not persist beyond the life of the operation.  
796 The description of each operation attribute includes conformance statements indicating which  
797 operation attributes are REQUIRED and which are OPTIONAL for an IPP object to support and  
798 which attributes a client MUST supply in a request and an IPP object MUST supply in a response.
- 799 - Job Template Attributes: These attributes affect the processing of a job. A client OPTIONALLY  
800 supplies Job Template Attributes in a create request, and the receiving object MUST be prepared to  
801 receive all supported attributes. The Job object can later be queried to find out what Job Template  
802 attributes were originally requested in the create request, and such attributes are returned in the  
803 response as Job Object Attributes. The Printer object can be queried about its Job Template  
804 attributes to find out what type of job processing capabilities are supported and/or what the default  
805 job processing behaviors are, though such attributes are returned in the response as Printer Object  
806 Attributes. The "ipp-attribute-fidelity" operation attribute affects processing of all client-supplied  
807 Job Template attributes (see sections 3.2.1.2 and 15 for a full description of "ipp-attribute-fidelity"  
808 and its relationship to other attributes).
- 809 - Job Object Attributes: These attributes are returned in response to a query operation directed at a Job  
810 object.
- 811 - Printer Object Attributes: These attributes are returned in response to a query operation directed at a  
812 Printer object.

813 - Unsupported Attributes: In a create request, the client supplies a set of Operation and Job Template  
814 attributes. If any of these attributes or their values is unsupported by the Printer object, the Printer  
815 object returns the set of unsupported attributes in the response. Sections 3.1.7, 3.2.1.2, and 15 give  
816 a full description of how Job Template attributes supplied by the client in a create request are  
817 processed by the Printer object and how unsupported attributes are returned to the client. Because  
818 of extensibility, any IPP object might receive a request that contains new or unknown attributes or  
819 values for which it has no support. In such cases, the IPP object processes what it can and returns  
820 the unsupported attributes in the response. The Unsupported Attribute group is defined for all  
821 operation responses for returning unsupported attributes that the client supplied in the request.  
822

823 Later in this section, each operation is formally defined by identifying the allowed and expected groups of  
824 attributes for each request and response. The model identifies a specific order for each group in each  
825 request or response, but the attributes within each group may be in any order, unless specified otherwise.

826 Each attribute specificationdefinition includes the attribute's name followed by the name of its attribute  
827 syntax(es) in parentheses. In addition, each 'integer' attribute is followed by the allowed range in  
828 parentheses, (m:n), for values of that attribute. Each 'text' or 'name' attribute is followed by the maximum  
829 size in octets in parentheses, (size), for values of that attribute. For more details on attribute syntax notation,  
830 see the descriptions of these attributes syntaxes in section 4.1.

831 Note: Document data included in the operation is not strictly an attribute, but it is treated as a special  
832 attribute group for ordering purposes. The only operations that support supplying the document data within  
833 an operation request are Print-Job and Send-Document. There are no operation responses that include  
834 document data.

835 ~~Note:~~ Some operations are REQUIRED for IPP objects to support; the others are OPTIONAL (see section  
836 0). Therefore, before using an OPTIONAL operation, a client SHOULD first use the REQUIRED Get-  
837 Printer-Attributes operation to query the Printer's "operations-supported" attribute in order to determine  
838 which OPTIONAL Printer and Job operations are actually supported. The client SHOULD NOT use an  
839 OPTIONAL operation that is not supported. When an IPP object receives a request to perform an operation  
840 it does not support, it returns the 'server-error-operation-not-supported' status code (see section 13.1.5.2).  
841 An IPP object is non-conformant if it does not support a REQUIRED operation.

#### 842 3.1.4 Character Set and Natural Language Operation Attributes

843 Some Job and Printer attributes have values that are text strings and names intended for human  
844 understanding rather than machine understanding (see the 'text' and 'name' attribute syntax descriptions in  
845 section 4.1). The following sections describe two special Operation Attributes called "attributes-charset"  
846 and "attributes-natural-language". These attributes are always part of the Operation Attributes group. For  
847 most attribute groups, the order of the attributes within the group is not important. However, for these two  
848 attributes within the Operation Attributes group, the order is critical. The "attributes-charset" attribute  
849 MUST be the first attribute in the group and the "attributes-natural-language" attribute MUST be the second  
850 attribute in the group. In other words, these attributes MUST be supplied in every IPP request and  
851 response, they MUST come first in the group, and MUST come in the specified order. For job creation  
852 operations, the IPP Printer implementation saves these two attributes with the new Job object as Job

853 Description attributes. For the sake of brevity in this document, these operation attribute descriptions are  
854 not repeated with every operation request and response, but have a reference back to this section instead.

#### 855 3.1.4.1 Request Operation Attributes

856 The client MUST supply and the Printer object MUST support the following REQUIRED operation  
857 attributes in every ~~IPP/1.0~~IPP/1.1 operation request:

858 "attributes-charset" (charset):

859 This operation attribute identifies the charset (coded character set and encoding method) used by  
860 any 'text' and 'name' attributes that the client is supplying in this request. It also identifies the  
861 charset that the Printer object MUST use (if supported) for all 'text' and 'name' attributes and status  
862 messages that the Printer object returns in the response to this request. See Sections 4.1.1 and 4.1.2  
863 for the ~~specification~~definition of the 'text' and 'name' attribute syntaxes.

864  
865 All clients and IPP objects MUST support the 'utf-8' charset [~~RFC2044~~][RFC2279] and MAY  
866 support additional charsets provided that they are registered with IANA [IANA-CS]. If the Printer  
867 object does not support the client supplied charset value, the Printer object MUST reject the request,  
868 set the "attributes-charset" to 'utf-8' in the response, and return the 'client-error-charset-not-  
869 supported' status code and any 'text' or 'name' attributes using the 'utf-8' charset. The Printer NEED  
870 NOT return any attributes in the Unsupported Attributes Group (See sections 3.1.7 and 3.2.1.2).  
871 The Printer object MUST indicate the charset(s) supported as the values of the "charset-supported"  
872 Printer attribute (see Section 4.4.18), so that the client can query to determine which charset(s) are  
873 supported.

874  
875 Note to client implementers: Since IPP objects are only required to support the 'utf-8' charset, in  
876 order to maximize interoperability with multiple IPP object implementations, a client may want to  
877 supply 'utf-8' in the "attributes-charset" operation attribute, even though the client is only passing  
878 and able to present a simpler charset, such as US-ASCII or ISO-8859-1. Then the client will have to  
879 filter out (or charset convert) those characters that are returned in the response that it cannot present  
880 to its user. On the other hand, if both the client and the IPP objects also support a charset in  
881 common besides utf-8, the client may want to use that charset in order to avoid charset conversion  
882 or data loss.

883  
884 See the 'charset' attribute syntax description in Section 4.1.7 for the syntax and semantic  
885 interpretation of the values of this attribute and for example values.

886  
887 "attributes-natural-language" (naturalLanguage):

888 This operation attribute identifies the natural language used by any 'text' and 'name' attributes that  
889 the client is supplying in this request. This attribute also identifies the natural language that the  
890 Printer object SHOULD use for all 'text' and 'name' attributes and status messages that the Printer  
891 object returns in the response to this request.

892  
893 There are no REQUIRED natural languages required for the Printer object to support. However, the  
894 Printer object's "generated-natural-language-supported" attribute identifies the natural languages

895 supported by the Printer object and any contained Job objects for all text strings generated by the  
896 IPP object. A client MAY query this attribute to determine which natural language(s) are supported  
897 for generated messages.

898  
899 For any of the attributes for which the Printer object generates text, i.e., for the "job-state-message",  
900 "printer-state-message", and status messages (see Section 3.1.6), the Printer object MUST be able to  
901 generate these text strings in any of its supported natural languages. If the client requests a natural  
902 language that is not supported, the Printer object MUST return these generated messages in the  
903 Printer's configured natural language as specified by the Printer's "natural-language-configured"  
904 attribute" (see Section 4.4.19).

905  
906 For other 'text' and 'name' attributes supplied by the client, authentication system, operator, system  
907 administrator, or manufacturer (i.e., for "job-originating-user-name", "printer-name" (name),  
908 "printer-location" (text), "printer-info" (text), and "printer-make-and-model" (text)), the Printer  
909 object is only required to support the configured natural language of the Printer identified by the  
910 Printer object's "natural-language-configured" attribute, though support of additional natural  
911 languages for these attributes is permitted.

912  
913 For any 'text' or 'name' attribute in the request that is in a different natural language than the value  
914 supplied in the "attributes-natural-language" operation attribute, the client MUST use the Natural  
915 Language Override mechanism (see sections 4.1.1.2 and 4.1.2.2) for each such attribute value  
916 supplied. The client MAY use the Natural Language Override mechanism redundantly, i.e., use it  
917 even when the value is in the same natural language as the value supplied in the "attributes-natural-  
918 language" operation attribute of the request.

919  
920 The IPP object MUST accept any natural language and any Natural Language Override, whether the  
921 IPP object supports that natural language or not (and independent of the value of the "ipp-attribute-  
922 fidelity" Operation attribute). That is the IPP object accepts all client supplied values no matter  
923 what the values are in the Printer object's "generated-natural-language-supported" attribute. That  
924 attribute, "generated-natural-language-supported", only applies to generated messages, not client  
925 supplied messages. The IPP object MUST remember that natural language for all client-supplied  
926 attributes, and when returning those attributes in response to a query, the IPP object MUST indicate  
927 that natural language.

928  
929 Each value whose attribute syntax type is ~~'text' or 'name'~~ 'text' or 'name' (see sections 4.1.1 and  
930 4.1.2) has an Associated Natural-Language. This document does not specify how this association is  
931 stored in a Printer or Job object. When such a value is encoded in a request or response, the natural  
932 language is either implicit or explicit:

933  
934 

- — In the implicit case, the value contains only the text/name value, and the language is  
935 specified by the ~~"attributes-natural-language"~~ "attributes-natural-language" operation  
936 attribute in the request or response (see sections 4.1.1.1 textWithoutLanguage and 4.1.2.1  
937 nameWithoutLanguage).

938

- In the explicit case (also known as the Natural-Language Override case), the value contains both the language and the text/name value (see sections 4.1.1.2 textWithLanguage and 4.1.2.2 nameWithLanguage).

For example, the "job-name" attribute MAY be supplied by the client in a create request. The text value for this attribute will be in the natural language identified by the "attribute-natural-language" attribute, or if different, as identified by the Natural Language Override mechanism. If supplied, the IPP object will use the value of the "job-name" attribute to populate the Job object's "job-name" attribute. Whenever any client queries the Job object's "job-name" attribute, the IPP object returns the attribute as stored and uses the Natural Language Override mechanism to specify the natural language, if it is different from that reported in the "attributes-natural-language" operation attribute of the response. The IPP object MAY use the Natural Language Override mechanism redundantly, i.e., use it even when the value is in the same natural language as the value supplied in the "attributes-natural-language" operation attribute of the response.

An IPP object MUST NOT reject a request based on a supplied natural language in an "attributes-natural-language" Operation attribute or in any attribute that uses the Natural Language Override.

See the 'naturalLanguage' attribute syntax description in section 4.1.8 for the syntax and semantic interpretation of the values of this attribute and for example values.

Clients SHOULD NOT supply 'text' or 'name' attributes that use an illegal combination of natural language and charset. For example, suppose a Printer object supports charsets 'utf-8', 'iso-8859-1', and 'iso-8859-7'. Suppose also, that it supports natural languages 'en' (English), 'fr' (French), and 'el' (Greek). Although the Printer object supports the charset 'iso-8859-1' and natural language 'el', it probably does not support the combination of Greek text strings using the 'iso-8859-1' charset. The Printer object handles this apparent incompatibility differently depending on the context in which it occurs:

- In a create request: If the client supplies a text or name attribute (for example, the "job-name" operation attribute) that uses an apparently incompatible combination, it is a client choice that does not affect the Printer object or its correct operation. Therefore, the Printer object simply accepts the client supplied value, stores it with the Job object, and responds back with the same combination whenever the client (or any client) queries for that attribute.
- In a query-type operation, like Get-Printer-Attributes: If the client requests an apparently incompatible combination, the Printer object responds (as described in section 3.1.4.2) using the Printer's configured natural language rather than the natural language requested by the client.

In either case, the Printer object does not reject the request because of the apparent incompatibility. The potential incompatible combination of charset and natural language can occur either at the global operation level or at the Natural Language Override attribute-by-attribute level. In addition, since the response always includes explicit charset and natural language information, there is never any question or ambiguity in how the client interprets the response.

980 3.1.4.2 Response Operation Attributes

981 The Printer object MUST supply and the client MUST support the following REQUIRED operation  
982 attributes in every ~~IPP/1.0~~IPP/1.1 operation response:

983 "attributes-charset" (charset):

984 This operation attribute identifies the charset used by any 'text' and 'name' attributes that the Printer  
985 object is returning in this response. The value in this response MUST be the same value as the  
986 "attributes-charset" operation attribute supplied by the client in the request. If this is not possible  
987 (i.e., the charset requested is not supported), the request would have been rejected. See "attributes-  
988 charset" described in Section 3.1.4.1 above.

989  
990 If the Printer object supports more than just the 'utf-8' charset, the Printer object MUST be able to  
991 code convert between each of the charsets supported on a highest fidelity possible basis in order to  
992 return the 'text' and 'name' attributes in the charset requested by the client. However, some  
993 information loss MAY occur during the charset conversion depending on the charsets involved. For  
994 example, the Printer object may convert from a UTF-8 'a' to a US-ASCII 'a' (with no loss of  
995 information), from an ISO Latin 1 CAPITAL LETTER A WITH ACUTE ACCENT to US-ASCII  
996 'A' (losing the accent), or from a UTF-8 Japanese Kanji character to some ISO Latin 1 error  
997 character indication such as '?', decimal code equivalent, or to the absence of a character, depending  
998 on implementation.

999  
1000 ~~Note:~~ Whether an implementation that supports more than one charset stores the data in the charset  
1001 supplied by the client or code converts to one of the other supported charsets, depends on  
1002 implementation. The strategy should try to minimize loss of information during code conversion.  
1003 On each response, such an implementation converts from its internal charset to that requested.

1004  
1005 "attributes-natural-language" (naturalLanguage):

1006 This operation attribute identifies the natural language used by any 'text' and 'name' attributes that  
1007 the IPP object is returning in this response. Unlike the "attributes-charset" operation attribute, the  
1008 IPP object NEED NOT return the same value as that supplied by the client in the request. The IPP  
1009 object MAY return the natural language of the Job object or the Printer's configured natural  
1010 language as identified by the Printer object's "natural-language-configured" attribute, rather than the  
1011 natural language supplied by the client. For any 'text' or 'name' attribute or status message in the  
1012 response that is in a different natural language than the value returned in the "attributes-natural-  
1013 language" operation attribute, the IPP object MUST use the Natural Language Override mechanism  
1014 (see sections 4.1.1.2 and 4.1.2.2) on each attribute value returned. The IPP object MAY use the  
1015 Natural Language Override mechanism redundantly, i.e., use it even when the value is in the same  
1016 natural language as the value supplied in the "attributes-natural-language" operation attribute of the  
1017 response.

1018 3.1.5 Operation Targets

1019 All IPP operations are directed at IPP objects. For Printer operations, the operation is always directed at a  
1020 Printer object using one of its URIs (i.e., one of the values in the Printer object's "printer-uri-supported"  
1021 attribute). Even if the Printer object supports more than one URI, the client supplies only one URI as the

1022 target of the operation. The client identifies the target object by supplying the correct URI in the "printer-  
1023 uri (uri)" operation attribute.

1024 For Job operations, the operation is directed at either:

- 1025 - The Job object itself using the Job object's URI. In this case, the client identifies the target object by  
1026 supplying the correct URI in the "job-uri (uri)" operation attribute.
- 1027 - The Printer object that created the Job object using both the Printer objects URI and the Job object's  
1028 Job ID. Since the Printer object that created the Job object generated the Job ID, it MUST be able to  
1029 correctly associate the client supplied Job ID with the correct Job object. The client supplies the  
1030 Printer object's URI in the "printer-uri (uri)" operation attribute and the Job object's Job ID in the  
1031 "job-id (integer(1:MAX))" operation attribute.

1032  
1033 If the operation is directed at the Job object directly using the Job object's URI, the client MUST NOT  
1034 include the redundant "job-id" operation attribute.

1035 The operation target attributes are REQUIRED operation attributes that MUST be included in every  
1036 operation request. Like the charset and natural language attributes (see section 3.1.4), the operation target  
1037 attributes are specially ordered operation attributes. In all cases, the operation target attributes immediately  
1038 follow the "attributes-charset" and "attributes-natural-language" attributes within the operation attribute  
1039 group, however the specific ordering rules are:

- 1040 - In the case where there is only one operation target attribute (i.e., either only the "printer-uri" attribute  
1041 or only the "job-uri" attribute), that attribute MUST be the third attribute in the operation attributes  
1042 group.
- 1043 - In the case where Job operations use two operation target attributes (i.e., the "printer-uri" and "job-id"  
1044 attributes), the "printer-uri" attribute MUST be the third attribute and the "job-id" attribute MUST  
1045 be the fourth attribute.

1046  
1047 In all cases, the target URIs contained within the body of IPP operation requests and responses must be in  
1048 absolute format rather than relative format (a relative URL identifies a resource with the scope of the HTTP  
1049 server, but does not include scheme, host or port).

1050 The following rules apply to the use of port numbers in URIs that identify IPP objects:

- 1051 1. If the URI scheme allows the port number to be explicitly included in the URI string, and a port  
1052 number is specified within the URI, then that port number MUST be used by the client to contact  
1053 the IPP object.
  - 1054 2. If the URI scheme allows the port number to be explicitly included in the URI string, and a port  
1055 number is not specified within the URI, then default port number implied by that URI scheme  
1056 MUST be used by the client to contact the IPP object.
  - 1057 3. If the URI scheme does not allow an explicit port number to be specified within the URI, then the  
1058 default port number implied by that URI MUST be used by the client to contact the IPP object.
- 1059  
1060  
1061

1062 Note: The IPP ~~encoding and transport~~ "Encoding and Transport" document [IPP-PRO] shows a mapping of  
1063 IPP onto HTTP/1.1 [RFC2616] and defines a new default port number for using IPP over HTTP/1.1.

1064 3.1.6 Operation Response Status Codes and Status Messages

1065 Every operation response includes a REQUIRED "status-code" parameter and an OPTIONAL "status-  
1066 message" operation attribute, and an OPTIONAL "detailed-status-message" operation attribute. The Print-  
1067 URI and Send-URI response MAY include an OPTIONAL "document-access-error" operation attribute.

1068 3.1.6.1 "status-code" (type2 enum)

1069 The REQUIRED "status-code" parameter provides information on the processing of a request. ~~A "status-~~  
1070 ~~message" attribute provides a short textual description of the status of the operation.~~

1071 ~~The status code is intended for use by automata, and the status message is intended for the human end user.~~  
1072 ~~If a response does include a "status-message" attribute, an IPP client NEED NOT examine or display the~~  
1073 ~~message, however it SHOULD do so in some~~ automata. A client implementation specific manner of IPP  
1074 SHOULD convert status code values into any localized message that has semantic meaning to the end user.

1075 The "status-code" value is a numeric value that has semantic meaning. The "status-code" syntax is similar  
1076 to a "type2 enum" (see section 4.1 on "Attribute Syntaxes") except that values can range only from 0x0000  
1077 to 0x7FFF. Section 13 describes the status codes, assigns the numeric values, and suggests a corresponding  
1078 status message for each status code for use by the client when the user's natural language is English.

1079 If the Printer performs an operation with no errors and it encounters no problems, it MUST return the status  
1080 code 'successful-ok' in the response. See section 13.

1081 If the client supplies unsupported values for the following parameters or Operation attributes, the Printer  
1082 object MUST reject the operation, NEED NOT return the unsupported attribute value in the Unsupported  
1083 Attributes group, and MUST return the indicated status code:

<u>Parameter/Attribute</u>	<u>Status code</u>
<u>version-number</u>	<u>server-error-version-not-supported</u>
<u>operation-id</u>	<u>server-error-operation-not-supported</u>
<u>attributes-charset</u>	<u>client-error-charset-not-supported</u>
<u>compression</u>	<u>client-error-compression-not-supported</u>
<u>document-format</u>	<u>client-error-document-format-not-supported</u>
<u>document-uri</u>	<u>client-error-uri-scheme-not-supported,</u> <u>client-error-document-access-error</u>

1084  
1085 If the client supplies unsupported values for other attributes, or unsupported attributes, the Printer returns  
1086 the status code defined in section 3.1.7 on Unsupported Attributes.

3.1.6.2 "status-message" (text(255))

~~code.~~The OPTIONAL "status-message" operation attribute provides a short textual description of the status of the operation. The "status-message" attribute's syntax is "text(255)", so the maximum length is 255 octets (see section 4.1.1). The status message is intended for the human end user. If a response does include a "status-"~~text(255)~~" attribute, an IPP client NEED NOT examine or display the messages, however it SHOULD do so in some implementation specific manner. The "status-message" is especially useful for a later version of a Printer object to return as supplemental information for the human user to accompany a status code that an earlier ~~of IPP SHOULD convert status code values into any localized message that has semantic meaning to the end user.~~version of a client might not understand.

If the Printer object supports the "status-message" operation attribute, the Printer object MUST be able to generate this message in any of the natural languages identified by the Printer object's "generated-natural-language-supported" attribute (see the "attributes-natural-language" operation attribute specified in section 3.1.4.1). Section 13 suggests the text for the status message returned by the Printer for use with the English natural language.

As described in section 3.1.4.1 for any returned 'text' attribute, if there is a choice for generating this message, the Printer object uses the natural language indicated by the value of the "attributes-natural-language" in the client request if supported, otherwise the Printer object uses the value in the Printer object's own "natural-language-configured" attribute.

If the Printer object supports the "status-message" operation attribute, it SHOULD use the REQUIRED 'utf-8' charset to return a status message for the following error status codes (see section 13): 'client-error-bad-request', 'client-error-charset-not-supported', 'server-error-internal-error', ~~server-~~'server-error-operation-not-supported', and 'server-error-version-not-supported'. In this case, it MUST set the value of the "attributes-charset" operation attribute to 'utf-8' in the error response.

3.1.6.3 "detailed-status-message" (text(MAX))

The OPTIONAL "detailed-status-message" operation attribute provides additional more detailed technical and implementation-specific information about the operation. The "detailed-status-message" attribute's syntax is "text(MAX)", so the maximum length is 1023 octets (see section 4.1.1). If the Printer objects supports the "detailed-status-message" operation attribute, neither the Printer nor the client localizes the message, since it is intended for use by the system administrator or other experienced technical persons. Clients MUST NOT attempt to parse the value of this attribute. See the "document-access-error" operation attribute (section 3.1.6.4) for additional errors that a program can process.

3.1.6.4 "document-access-error" (text(MAX))

This OPTIONAL operation attribute provides additional information about any document access errors encountered by the Printer before it returned a response to the Print-URI (section 3.2.2) or Send-URI (section 3.3.1) operation. For errors in the protocol identified by the URI scheme in the "document-uri" operation attribute, such as 'http:' or 'ftp:', the error code is returned in parentheses, followed by the URI. For example:

(404) [http://ftp.pwg.org/pub/pwg/ipp/new\\_MOD/ipp-model-v11-990510.pdf](http://ftp.pwg.org/pub/pwg/ipp/new_MOD/ipp-model-v11-990510.pdf)

Most Internet protocols use decimal error codes (unlike IPP), so the ASCII error code representation is in decimal.

### 3.1.7 Unsupported Attributes

The Unsupported Attributes group contains attributes that are not supported by the operation. This group is primarily for the job creation operations, but all operations can return this group.

A Printer object MUST include an Unsupported Attributes group in a response if the status code is one of the following: 'successful-ok-ignored-or-substituted-attributes', 'successful-ok-conflicting-attributes', 'client-error-attributes-or-values-not-supported' or 'client-error-conflicting-attributes'.

If the status code is one of the four specified in the preceding paragraph, the Unsupported Attributes group MUST contain all of those attributes and only those attributes that are:

- a. an Operation or Job Template attribute supplied in the request, and
- b. unsupported by the printer. See below for details on the three categories "unsupported" attributes.

If the Printer object is not returning any Unsupported Attributes in the response, the Printer object SHOULD omit Group 2 rather than sending an empty group. However, a client MUST be able to accept an empty group.

Unsupported attributes fall into three categories:

1. The Printer object does not support the supplied attribute (no matter what the attribute syntax or value).
2. The Printer object does support the attribute, but does not support some or all of the particular attribute syntaxes or values supplied by the client (i.e., the Printer object does not have those attribute syntaxes or values in its corresponding "xxx-supported" attribute).
3. The Printer object does support the attributes and values supplied, but the particular values are in conflict with one another, because they violate a constraint, such as not being able to staple transparencies.

In the case of an unsupported attribute name, the Printer object returns the client-supplied attribute with a substituted value of 'unsupported'. This value's syntax type is "out-of-band" and its encoding is defined by special rules for "out-of-band" values in the "Encoding and Transport" document [IPP-PRO]. Its value indicates no support for the attribute itself (see the beginning of section 4.1).

In the case of a supported attribute with one or more unsupported attribute syntaxes or values, the Printer object simply returns the client-supplied attribute with the unsupported attribute syntaxes or values as supplied by the client. This indicates support for the attribute, but no support for that particular attribute syntax or value. If the client supplies a multi-valued attribute with more than one value and the Printer

1158 object supports the attribute but only supports a subset of the client-supplied attribute syntaxes or values,  
1159 the Printer object MUST return only those attribute syntaxes or values that are unsupported.

1160 In the case of two (or more) supported attribute values that are in conflict with one another (although each  
1161 is supported independently, the values conflict when requested together within the same job), the Printer  
1162 object MUST return all the values that it ignores or substitutes to resolve the conflict, but not any of the  
1163 values that it is still using. The choice for exactly how to resolve the conflict is implementation dependent.  
1164 See sections 3.2.1.2 and 15. See The Implementer's Guide [IPP-IIG] for an example.

### 1165 3.1.8 Versions

1166 Each operation request and response carries with it a "version-number" parameter. Each value of the  
1167 "version-number" is in the form "X.Y" where X is the major version number and Y is the minor version  
1168 number. By including a version number in the client request, it allows the client to identify which version  
1169 of IPP it is interested in ~~using~~ using, i.e., the version whose conformance requirements the client may be  
1170 depending upon the Printer to meet.

1171 If the IPP object does not support that ~~version~~ major version number supplied by the client, i.e., the major  
1172 version field of the "version-number" parameter does not match any of the values of the Printer's "ipp-  
1173 versions-supported" (see section 4.4.14), the object responds MUST respond with a status code of 'server-  
1174 error-version-not-supported' along with the closest version number that is supported (see section 13.1.5.4).  
1175 If the major version number is supported, but the minor version number is not, the IPP object SHOULD  
1176 accept and attempt to perform the request (or reject the request if the operation is not supported), else it  
1177 rejects the request and returns the 'server-error-version-not-supported' status code. In all cases, the IPP  
1178 object MUST return the "version-number" that it supports that is closest to the version number supplied by  
1179 the client in the request.

1180 There is no version negotiation per se. However, if after receiving a 'server-error-version-not-supported'  
1181 status code from an IPP object, ~~there is nothing that prevents a client from trying~~ a client SHOULD try again  
1182 with a different version number. A client MAY also determine the versions supported either from a  
1183 directory that conforms to Appendix E (see section 16) or by querying the Printer object's "ipp-versions-  
1184 supported" attribute (see section 4.4.14) to determine which versions are supported.

1185 ~~In order to conform to IPP/1.0, an~~ An IPP object implementation MUST support ~~at least version '1.0'~~  
1186 version '1.1', i.e., meet the conformance requirements for IPP/1.1 as specified in this document and [IPP-  
1187 PRO]. It is recommended that IPP object implementations accept any request with the major version '1' (or  
1188 reject the request if the operation is not supported).

1189 There is only one notion of "version number" that covers both IPP Model and IPP Protocol changes. Thus  
1190 the version number MUST change when introducing a new version of the Model and Semantics document  
1191 ~~[IPP-MOD](this document)~~ or a new version of the ~~Encoding and Transport~~ "Encoding and Transport"  
1192 document [IPP-PRO].

1193 Changes to the major version number of the Model and Semantics document indicate structural or syntactic  
1194 changes that make it impossible for older version of IPP clients and Printer objects to correctly parse and  
1195 correctly process the new or changed attributes, operations and responses. If the major version number

1196 changes, the minor version numbers is set to zero. As an example, adding the **REQUIRED** "ipp-attribute-  
 1197 fidelity" attribute to version '1.1' (if it had not been part of version '1.0'), would have required a change to  
 1198 the major version number, since an IPP/1.0 Printer would not have processed a request with the correct  
 1199 semantics that contained ~~number.~~ the "ipp-attribute-fidelity" attribute that it did not know about. Items that  
 1200 might affect the changing of the major version number include any changes to the Model and Semantics  
 1201 document [~~IPP-MOD~~] or the ~~Encoding and Transport~~ [~~IPP-~~ (this document)] or the "Encoding and  
 1202 Transport" document [~~IPP-PRO~~] itself, such as:

- 1203 - reordering of ordered attributes or attribute sets
- 1204 - changes to the syntax of existing attributes
- 1205 ~~- changing Operation or Job Template attributes from OPTIONAL to REQUIRED and vice versa~~
- 1206 ~~- adding REQUIRED (for an IPP object to support) operation attributes~~
- 1207 - adding REQUIRED (for an IPP object to support) operation attribute groups
- 1208 - adding values to existing **REQUIRED** operation attributes
- 1209 - adding REQUIRED operations
- 1210

1211 Changes to the minor version number indicate the addition of new features, attributes and attribute values  
 1212 that may not be understood by all IPP objects, but which can be ignored if not understood. Items that might  
 1213 affect the changing of the minor version number include any changes to the model objects and attributes but  
 1214 not the encoding and transport rules [IPP-PRO] (except adding attribute syntaxes). Examples of such  
 1215 changes are:

- 1216 - grouping all extensions not included in a previous version into a new version
- 1217 - adding new attribute values
- 1218 - adding new object attributes
- 1219 - adding OPTIONAL (for an IPP object to support) operation attributes (i.e., those attributes that an IPP  
 1220 object can ignore without confusing clients)
- 1221 - adding OPTIONAL (for an IPP object to support) operation attribute groups (i.e., those attributes that  
 1222 an IPP object can ignore without confusing clients)
- 1223 - adding new attribute syntaxes
- 1224 - adding OPTIONAL operations
- 1225 - changing Job Description attributes or Printer Description attributes from OPTIONAL to REQUIRED  
 1226 or vice versa.
- 1227 - adding OPTIONAL attribute syntaxes to an existing attribute.

1228 The encoding of the ~~"operation-id", the "version-number", the "status-code", and the "request-id"~~ "version-  
 1229 number" MUST NOT change over any version number (either major or minor). This rule guarantees that  
 1230 all future versions will be backwards compatible with all previous versions (at least for checking  
 1231 the ~~"operation-id", the "version-number", and the "request-id"~~ "version-number"). In addition, any  
 1232 protocol elements (attributes, error codes, tags, etc.) that are not carried forward from one version to the  
 1233 next are deprecated so that they can never be reused with new semantics.

1234 Implementations that support a certain **major** version NEED NOT support ALL previous versions. As each  
 1235 new **major** version is defined (through the release of a new ~~specification~~, that major IPP specification  
 1236 document), that version will specify which previous **major** versions MUST and which versions SHOULD  
 1237 be supported in compliant implementations.

1238 3.1.9 Job Creation Operations

1239 In order to "submit a print job" and create a new Job object, a client issues a create request. A create  
1240 request is any one of following three operation requests:

- 1241 - The Print-Job Request: A client that wants to submit a print job with only a single document uses the  
1242 Print-Job operation. The operation allows for the client to "push" the document data to the Printer  
1243 object by including the document data in the request itself.  
1244
- 1245 - The Print-URI Request: A client that wants to submit a print job with only a single document (where  
1246 the Printer object "pulls" the document data instead of the client "pushing" the data to the Printer  
1247 object) uses the Print-URI operation. In this case, the client includes in the request only a URI  
1248 reference to the document data (not the document data itself).  
1249
- 1250 - The Create-Job Request: A client that wants to submit a print job with multiple documents uses the  
1251 Create-Job operation. This operation is followed by an arbitrary number of Send-Document and/or  
1252 Send-URI operations (each creating another document for the newly create Job object). The Send-  
1253 Document operation includes the document data in the request (the client "pushes" the document  
1254 data to the printer), and the Send-URI operation includes only a URI reference to the document data  
1255 in the request (the Printer "pulls" the document data from the referenced location). The last Send-  
1256 Document or Send-URI request for a given Job object includes a "last-document" operation attribute  
1257 set to 'true' indicating that this is the last request.  
1258

1259 Throughout this model ~~specification,~~document, the term "create request" is used to refer to any of these  
1260 three operation requests.

1261 A Create-Job operation followed by only one Send-Document operation is semantically equivalent to a  
1262 Print-Job operation, however, for performance reasons, the client SHOULD use the Print-Job operation for  
1263 all single document jobs. Also, Print-Job is a REQUIRED operation (all implementations MUST support  
1264 it) whereas Create-Job is an OPTIONAL operation, hence some implementations might not support it.

1265 Job submission time is the point in time when a client issues a create request. The initial state of every Job  
1266 object is the ~~'pending' or 'pending-held' state. Later,~~'pending', 'pending-held', or 'processing' state (see  
1267 section 4.3.7). ~~When~~ the Printer object begins processing the print job. ~~At this point in time~~, the Job  
1268 object's state moves to 'processing'. This is known as job processing time. There are validation checks that  
1269 must be done at job submission time and others that must be performed at job processing time.

1270 At job submission time and at the time a Validate-Job operation is received, the Printer MUST do the  
1271 following:

- 1272 1. Process the client supplied attributes and either accept or reject the request
- 1273 2. Validate the syntax of and support for the scheme of any client supplied URI

1274  
1275 At job submission time the Printer object MUST validate whether or not the supplied attributes, attribute  
1276 syntaxes, and values are supported by matching them with the Printer object's corresponding "xxx-

1277 supported" attributes. See section 3.1.7 for details. [IPP-IIG] presents suggested steps for an IPP object to  
1278 either accept or reject any request and additional steps for processing create requests.

1279 At job submission time the Printer object NEED NOT perform the validation checks reserved for job  
1280 processing time such as:

- 1281 1. Validating the document data
- 1282 2. Validating the actual contents of any client supplied URI (resolve the reference and follow the link to  
1283 the document data)

1284  
1285 At job submission time, these additional job processing time validation checks are essentially useless, since  
1286 they require actually parsing and interpreting the document data, are not guaranteed to be 100% accurate,  
1287 and MUST be done, yet again, at job processing time. Also, in the case of a URI, checking for availability  
1288 at job submission time does not guarantee availability at job processing time. In addition, at job processing  
1289 time, the Printer object might discover any of the following conditions that were not detectable at job  
1290 submission time:

- 1291 - runtime errors in the document data,
- 1292 - nested document data that is in an unsupported format,
- 1293 - the URI reference is no longer valid (i.e., the server hosting the document might be down), or
- 1294 - any other job processing error

1295  
1296 At job submission time, a Printer object, especially a non-spooling Printer, MAY accept jobs that it does  
1297 not have enough space for. In such a situation, a Printer object MAY stop reading data from a client for an  
1298 indefinite period of time. A client MUST be prepared for a write operation to block for an indefinite period  
1299 of time (see section 5.1 on client conformance).

1300 When a Printer object has too little space for starting a new job, it MAY reject a new create request. In this  
1301 case, a Printer object MUST return a response (in reply to the rejected request) with a status-code of 'server-  
1302 error-busy' (see section 14.1.5.8) and it MAY close the connection before receiving all bytes of the  
1303 operation. A Printer SHOULD indicate that it is temporarily unable to accept jobs by setting the 'spool-  
1304 space-full' value in its "printer-state-reasons" attribute and removing the value when it can accept another  
1305 job (see section 4.4.12).

1306 When receiving a 'server-error-busy' status-code in an operation response, a client MUST be prepared for  
1307 the Printer object to close the connection before the client has sent all of the data (especially for the Print-  
1308 Job operation). A client MUST be prepared to keep submitting a create request until the IPP Printer object  
1309 accepts the create request.

1310 At job processing time, since the Printer object has already responded with a successful status code in the  
1311 response to the create request, if the Printer object detects an error, the Printer object is unable to inform the  
1312 end user of the error with an operation status code. In this case, the Printer, depending on the error, can set  
1313 the job object's "job-state", "job-state-reasons", or "job-state-message" attributes to the appropriate value(s)  
1314 so that later queries can report the correct job status.

1315 Note: Asynchronous notification of events is outside the scope of ~~IPP/1.0~~ this IPP/1.1 document.

1316

## 1317 3.2 Printer Operations

1318 All Printer operations are directed at Printer objects. A client MUST always supply the "printer-uri"  
1319 operation attribute in order to identify the correct target of the operation.

### 1320 3.2.1 Print-Job Operation

1321 This REQUIRED operation allows a client to submit a print job with only one document and supply the  
1322 document data (rather than just a reference to the data). See Section 15 for the suggested steps for  
1323 processing create operations and their Operation and Job Template attributes.

#### 1324 3.2.1.1 Print-Job Request

1325 The following groups of attributes are supplied as part of the Print-Job Request:

##### 1326 Group 1: Operation Attributes

1327 Natural Language and Character Set:

1328 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.  
1329 The Printer object MUST copy these values to the corresponding Job Description attributes  
1330 described in sections 0 and 4.3.20.

1331

1332 Target:

1333 The "printer-uri" (uri) operation attribute which is the target for this operation as described in  
1334 section 3.1.5.

1335

1336 Requesting User Name:

1337 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as  
1338 described in section 1.1.

1339

1340 "job-name" (name(MAX)):

1341 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It  
1342 contains the client supplied Job name. If this attribute is supplied by the client, its value is used for  
1343 the "job-name" attribute of the newly created Job object. The client MAY automatically include any  
1344 information that will help the end-user distinguish amongst his/her jobs, such as the name of the  
1345 application program along with information from the document, such as the document name,  
1346 document subject, or source file name. If this attribute is not supplied by the client, the Printer  
1347 generates a name to use in the "job-name" attribute of the newly created Job object (see Section  
1348 4.3.5).

1349

1350 "ipp-attribute-fidelity" (boolean):

1351 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute.  
1352 The value 'true' indicates that total fidelity to client supplied Job Template attributes and values is

required, else the Printer object MUST reject the Print-Job request. The value 'false' indicates that a reasonable attempt to print the Job object is acceptable and the Printer object MUST accept the Print-job request. If not supplied, the Printer object assumes the value is 'false'. All Printer objects MUST support both types of job processing. See section 15 for a full description of "ipp-attribute-fidelity" and its relationship to other attributes, especially the Printer object's "pdl-override-supported" attribute.

"document-name" (name(MAX)):

The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It contains the client supplied document name. The document name MAY be different than the Job name. Typically, the client software automatically supplies the document name on behalf of the end user by using a file name or an application generated name. If this attribute is supplied, its value can be used in a manner defined by each implementation. Examples include: printed along with the Job (job start sheet, page adornments, etc.), used by accounting or resource tracking management tools, or even stored along with the document as a document level attribute. ~~IPP/1.0~~ IPP/1.1 does not support the concept of document level attributes.

"compression" (type3 keyword)

The client OPTIONALLY supplies this attribute. The Printer object ~~OPTIONALLY supports~~ MUST support this attribute and the "compression-supported" attribute (see section 4.4.32). The client supplied "compression" operation attribute identifies the compression algorithm used on the document data. The following cases exist:

- a) If the client omits this attribute, the Printer object MUST assume that the data is not ~~compressed.~~ ~~compressed~~ (i.e. the Printer follows the rules below as if the client supplied the "compression" attribute with a value of 'none').  
~~If the client supplies the attribute and the Printer object supports the attribute, the Printer object uses the corresponding decompression algorithm on the document data.~~ If the client supplies this attribute, but the value is not supported by the Printer object, i.e., the value is not one of the values of the Printer object's "compression-supported" attribute, the Printer object MUST ~~copy the attribute and its value to the Unsupported Attributes response group,~~ reject the request, and return the ~~'client-error-attributes-or-values-not-supported'~~ 'status code:
- b) 'client-error-compression-not-supported' status code. See section 3.1.7 for returning unsupported attributes and values.
- c) If the client supplies the attribute and the Printer object supports the attribute value, the Printer object uses the corresponding decompression algorithm on the document data.
- d) If the decompression algorithm fails before the Printer returns an operation response, the Printer object MUST reject the request and return the 'client-error-compression-error' status code.
- e) If the decompression algorithm fails after the Printer returns an operation response, the Printer object MUST abort the job and add the 'compression-error' value to the job's "job-state-reasons" attribute.
- f) If the decompression algorithm succeeds, the document data MUST then have the format specified by the job's "document-format" attribute, if supplied (see "document-format" operation attribute definition below).

"document-format" (mimeMediaType) :

The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. The value of this attribute identifies the format of the supplied document data. The following cases exist:

- a) If the client does not supply this attribute, the Printer object assumes that the document data is in the format defined by the Printer object's "document-format-default" attribute. (i.e. the Printer follows the rules below as if the client supplied the "document-format" attribute with a value equal to the printer's default value).
- b) If the client supplies this attribute, but the value is not supported by the Printer object, i.e., the value is not one of the values of the Printer object's "document-format-supported" attribute, the Printer object MUST reject the request and return the 'client-error-document-format-not-supported' status code.
- c) If the client supplies this attribute and its value is 'application/octet-stream' (i.e. to be auto-sensed, see Section 4.1.9.1), and the format is not one of the document-formats that the Printer can auto-sense, and this check occurs before the Printer returns an operation response, then the Printer MUST reject the request and return the 'client-error-document-format-not-supported' status code.
- d) If the client supplies this attribute, and the value is supported by the Printer object, the document data, the Printer is capable of interpreting the document data.
- e) If interpreting of the document data fails before the Printer returns an operation response, the Printer object MUST reject the request and return the 'client-error-document-format-error' status code.
- f) If interpreting of the document data fails after the Printer returns an operation response, the Printer object MUST abort the job and add the 'document-format-error' value to the job's "job-state-reasons" attribute.

"document-natural-language" (naturalLanguage):

The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this attribute. This attribute specifies the natural language of the document for those document-formats that require a specification of the natural language in order to image the document unambiguously. There are no particular values required for the Printer object to support.

"job-k-octets" (integer(0:MAX))

The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this attribute and the "job-k-octets-supported" attribute (see section 4.4.33). The client supplied "job-k-octets" operation attribute identifies the total size of the document(s) in K octets being submitted (see section 4.3.17.1 for the complete semantics). If the client supplies the attribute and the Printer object supports the attribute, the value of the attribute is used to populate the Job object's "job-k-octets" Job Description attribute.

Note: For this attribute and the following two attributes ("job-impressions", and "job-media-sheets"), if the client supplies the attribute, but the Printer object does not support the attribute, the Printer object ignores the client-supplied value. If the client supplies the attribute and the Printer

1443 supports the attribute, and the value is within the range of the corresponding Printer object's "xxx-  
1444 supported" attribute, the Printer object MUST use the value to populate the Job object's "xxx"  
1445 attribute. If the client supplies the attribute and the Printer supports the attribute, but the value is  
1446 outside the range of the corresponding Printer object's "xxx-~~supported~~" ~~supported~~ attribute, the  
1447 Printer object MUST copy the attribute and its value to the Unsupported Attributes response group,  
1448 reject the request, and return the 'client-error-attributes-or-values-not-supported' status code. If the  
1449 client does not supply the attribute, the Printer object MAY choose to populate the corresponding  
1450 Job object attribute depending on whether the Printer object supports the attribute and is able to  
1451 calculate or discern the correct value.

1452

1453 "job-impressions" (integer(0:MAX))

1454 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this  
1455 attribute and the "job-impressions-supported" attribute (see section 4.4.34). The client supplied  
1456 "job-impressions" operation attribute identifies the total size in number of impressions of the  
1457 document(s) being submitted (see section 0 for the complete semantics).

1458

1459 See ~~note~~last paragraph under "job-k-octets".

1460

1461 "job-media-sheets" (integer(0:MAX))

1462 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this  
1463 attribute and the "job-media-sheets-supported" attribute (see section 4.4.35). The client supplied  
1464 "job-media-sheets" operation attribute identifies the total number of media sheets to be produced for  
1465 this job (see section 0 for the complete semantics).

1466

1467 See ~~note~~last paragraph under "job-k-octets".

1468

1469 Group 2: Job Template Attributes

1470 The client OPTIONALLY supplies a set of Job Template attributes as defined in section 4.2. If the  
1471 client is not supplying any Job Template attributes in the request, the client SHOULD omit Group 2  
1472 rather than sending an empty group. However, a Printer object MUST be able to accept an empty  
1473 group.

1474

1475 Group 3: Document Content

1476 The client MUST supply the document data to be processed.

1477

1478 ~~Note:~~ In addition to the MANDATORY parameters required for every operation request, the simplest Print-  
1479 Job Request consists of just the "attributes-charset" and "attributes-natural-language" operation attributes;  
1480 the "printer-uri" target operation attribute; the Document Content and nothing else. In this simple case, the  
1481 Printer object:

1482 - creates a new Job object (the Job object contains a single document),

- stores a generated Job name in the "job-name" attribute in the natural language and charset requested (see Section 3.1.4.1) (if those are supported, otherwise using the Printer object's default natural language and charset), and
- at job processing time, uses its corresponding default value attributes for the supported Job Template attributes that were not supplied by the client as IPP attribute or embedded instructions in the document data.

### 3.2.1.2 Print-Job Response

The Printer object MUST return to the client the following sets of attributes as part of the Print-Job Response:

#### Group 1: Operation Attributes

##### Status Message:

In addition to the REQUIRED status code returned in every response, the response OPTIONALLY includes a "status-message" (text(255)) and/or a "detailed-status-message" (text(MAX)) operation attribute as described in sections 13 and 3.1.6. If the client supplies unsupported or conflicting Job Template attributes or values, the Printer object MUST reject or accept the Print-Job request depending on the whether the client supplied a 'true' or 'false' value for the "ipp-attribute-fidelity" operation attribute. See the Implementer's Guide [IPP-IIG] for a complete description of the suggested steps for processing a create request.

##### Natural Language and Character Set:

The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.

#### Group 2: Unsupported Attributes

See section 3.1.7 for details on returning Unsupported Attributes.

~~In these three cases, the~~ The value of the "ipp-attribute-fidelity" supplied by the client does not affect what attributes the Printer object returns in this group. The value of "ipp-attribute-fidelity" only affects whether the Print-Job operation is accepted or rejected. If the job is accepted, the client may query the job using the Get-Job-Attributes operation requesting the unsupported attributes that were returned in the create response to see which attributes were ignored (not stored on the Job object) and which attributes were stored with other (substituted) values.

#### Group 3: Job Object Attributes

##### "job-uri" (uri):

The Printer object MUST return the Job object's URI by returning the contents of the REQUIRED "job-uri" Job object attribute. The client uses the Job object's URI when directing operations at the Job object. The Printer object always uses its configured security policy when creating the new URI. However, if the Printer object supports more than one URI, the Printer object also uses information about which URI was used in the Print-Job Request to generated the new URI so that

1523 the new URI references the correct access channel. In other words, if the Print-Job Request comes  
1524 in over a secure channel, the Printer object MUST generate a Job URI that uses the secure channel  
1525 as well.

1526  
1527 "job-id" (integer(1:MAX)):

1528 The Printer object MUST return the Job object's Job ID by returning the REQUIRED "job-id" Job  
1529 object attribute. The client uses this "job-id" attribute in conjunction with the "printer-uri" attribute  
1530 used in the Print-Job Request when directing Job operations at the Printer object.

1531  
1532 "job-state":

1533 The Printer object MUST return the Job object's REQUIRED "job-state" attribute. The value of this  
1534 attribute (along with the value of the next attribute: "job-state-reasons") is taken from a "snapshot"  
1535 of the new Job object at some meaningful point in time (implementation defined) between when the  
1536 Printer object receives the Print-Job Request and when the Printer object returns the response.

1537  
1538 "job-state-reasons":

1539 The Printer object ~~OPTIONALLY returns~~ **MUST return** the Job object's ~~OPTIONAL "job-state-~~  
1540 ~~reasons" attribute. If the Printer object supports this attribute then it MUST be returned in the~~  
1541 ~~response. If this attribute is not returned in the response, the client can assume that the "job-state-~~  
1542 ~~reasons" attribute is not supported and will not be returned in a subsequent Job object~~  
1543 ~~query.~~ **REQUIRED "job-state-reasons" attribute.**

1544  
1545 "job-state-message":

1546 The Printer object OPTIONALLY returns the Job object's OPTIONAL "job-state-message"  
1547 attribute. If the Printer object supports this attribute then it MUST be returned in the response. If  
1548 this attribute is not returned in the response, the client can assume that the "job-state-message"  
1549 attribute is not supported and will not be returned in a subsequent Job object query.

1550  
1551 "number-of-intervening-jobs":

1552 The Printer object OPTIONALLY returns the Job object's OPTIONAL "number-of-intervening-  
1553 jobs" attribute. If the Printer object supports this attribute then it MUST be returned in the response.  
1554 If this attribute is not returned in the response, the client can assume that the "number-of-  
1555 intervening-jobs" attribute is not supported and will not be returned in a subsequent Job object  
1556 query.

1557  
1558 Note: Since any printer state information which affects a job's state is reflected in the "job-state" and  
1559 "job-state-reasons" attributes, it is sufficient to return only these attributes and no specific printer  
1560 status attributes.

1562 Note: In addition to the MANDATORY parameters required for every operation response, the simplest  
1563 response consists of the just the "attributes-charset" and "attributes-natural-language" operation attributes  
1564 and the "job-uri", "job-id", and "job-state" Job Object Attributes. In this simplest case, the status code is  
1565 ~~"successful-ok"~~ **successful-ok** and there is no "status-message" ~~or "detailed-status-message"~~ operation  
1566 attribute.

1567 3.2.2 Print-URI Operation

1568 This OPTIONAL operation is identical to the Print-Job operation (section 3.2.1) except that a client  
1569 supplies a URI reference to the document data using the "document-uri" (uri) operation attribute (in Group  
1570 1) rather than including the document data itself. Before returning the response, the Printer MUST validate  
1571 that the Printer supports the retrieval method (e.g., http, ftp, etc.) implied by the URI, and MUST check for  
1572 valid URI syntax. If the client-supplied URI scheme is not supported, i.e. the value is not in the Printer  
1573 object's "referenced-uri-scheme-supported" attribute, the Printer object MUST reject the request and return  
1574 the 'client-error-uri-scheme-not-supported' status code.

1575 The IPP Printer MAY validate the accessibility of the document as part of the operation or subsequently. If  
1576 the Printer determines an accessibility problem before returning an operation response, it rejects the request  
1577 and returns the 'client-error-document-access-error' status code. The Printer MAY also return a specific  
1578 document access error code using the "document-access-error" operation attribute (see section 3.1.6.4).

1579 If the Printer determines this document accessibility problem after accepting the request and returning an  
1580 operation response with one of the successful status codes, the Printer adds the 'document-access-error'  
1581 value to the job's "job-state-reasons" attribute and MAY populate the job's "job-document-access-errors"  
1582 Job Description attribute (see section 4.3.11). See The Implementer's Guide [IPP-IIG] for suggested  
1583 additional checks. ~~The Printer NEED NOT follow the reference and validate the contents of the reference.~~

1584 If the Printer object supports this operation, it MUST support the "reference-uri-schemes-supported" Printer  
1585 attribute (see section 4.4.27).

1586 It is up to the IPP object to interpret the URI and subsequently "pull" the document from the source  
1587 referenced by the URI string.

1588 3.2.3 Validate-Job Operation

1589 This REQUIRED operation is similar to the Print-Job operation (section 3.2.1) except that a client supplies  
1590 no document data and the Printer allocates no resources (i.e., it does not create a new Job object). This  
1591 operation is used only to verify capabilities of a printer object against whatever attributes are supplied by  
1592 the client in the Validate-Job request. By using the Validate-Job operation a client can validate that an  
1593 identical Print-Job operation (with the document data) would be accepted. The Validate-Job operation also  
1594 performs the same security negotiation as the Print-Job operation (see section 8), so that a client can check  
1595 that the client and Printer object security requirements can be met before performing a Print-Job operation.

1596 ~~Note:~~ The Validate-Job operation does not accept a "document-uri" attribute in order to allow a client to  
1597 check that the same Print-URI operation will be accepted, since the client doesn't send the data with the  
1598 Print-URI operation. The client SHOULD just issue the Print-URI request.

1599 The Printer object returns the same status codes, Operation Attributes (Group 1) and Unsupported  
1600 Attributes (Group 2) as the Print-Job operation. However, no Job Object Attributes (Group 3) are returned,  
1601 since no Job object is created.

1602 3.2.4 Create-Job Operation

1603 This OPTIONAL operation is similar to the Print-Job operation (section 3.2.1) except that in the Create-Job  
1604 request, a client does not supply document data or any reference to document data. Also, the client does not  
1605 supply any of the "document-name", "document-format", "compression", or "document-natural-language"  
1606 operation attributes. This operation is followed by one or more Send-Document or Send-URI operations.  
1607 In each of those operation requests, the client OPTIONALLY supplies the "document-name", "document-  
1608 format", and "document-natural-language" attributes for each document in the multi-document Job object.

1609 If a Printer object supports the Create-Job operation, it MUST also support the Send-Document operation  
1610 and also MAY support the Send-URI operation.

1611 If the Printer object supports this operation, it MUST support the "multiple-operation-time-out" Printer  
1612 attribute (see section 4.4.31).

1613 ~~In addition to the Print-Job status codes in the following additional error status codes not applicable to~~  
1614 ~~Print-Job MAY be returned:~~

1615 If the Printer object supports this operation, then it MUST support the "multiple-document-jobs-supported"  
1616 Printer Description attribute (see section 4.4.16) and indicate whether or not it supports multiple-document  
1617 jobs.

1618 If the Printer object supports this operation and supports multiple documents in a job, then it MUST support  
1619 the "multiple-document-handling" Job Template job attribute with at least one value (see section 4.2.4) and  
1620 the associated "multiple-document-handling-default" and "multiple-document-handling-supported" Job  
1621 Template Printer attributes (see section 4.2).

1622 After the Create-Job operation has completed, the value of the "job-state" attribute is similar to the "job-  
1623 state" after a Print-Job, even though no document-data has arrived. A Printer MAY set the 'job-data-  
1624 insufficient' value of the job's "job-state-reason" attribute to indicate that processing cannot begin until  
1625 sufficient data has arrived and set the "job-state" to either 'pending' or 'pending-held'. A non-spooling  
1626 printer that doesn't implement the 'pending' job state may even set the "job-state" to 'processing', even  
1627 though there is not yet any data to process. See sections 4.3.7 and 4.3.8.

1628 3.2.5 Get-Printer-Attributes Operation

1629 This REQUIRED operation allows a client to request the values of the attributes of a Printer object. In the  
1630 request, the client supplies the set of Printer attribute names and/or attribute group names in which the  
1631 requester is interested. In the response, the Printer object returns a corresponding attribute set with the  
1632 appropriate attribute values filled in.

1633 For Printer objects, the possible names of attribute groups are:

- 1634 - 'job-template': all the subset of the Job Template attributes that apply to a Printer object (the last two  
1635 columns of the table in Section 4.2) that the implementation supports for Printer objects.

- 1636 - 'printer-description': the subset of the attributes specified in Section 4.4 that the implementation
- 1637 supports for Printer objects.
- 1638 - 'all': the special group 'all' that includes all ~~supported attributes.~~ attributes that the implementation
- 1639 supports for Printer objects.
- 1640

1641 Since a client MAY request specific attributes or named groups, there is a potential that there is some  
1642 overlap. For example, if a client requests, 'printer-name' and 'all', the client is actually requesting the  
1643 "printer-name" attribute twice: once by naming it explicitly, and once by inclusion in the 'all' group. In such  
1644 cases, the Printer object NEED NOT return each attribute only once in the response even if it is requested  
1645 multiple times. The client SHOULD NOT request the same attribute in multiple ways.

1646 It is NOT REQUIRED that a Printer object support all attributes belonging to a group (since some attributes  
1647 are OPTIONAL). However, it is REQUIRED that each Printer object support all group names.

### 1648 3.2.5.1 Get-Printer-Attributes Request

1649 The following sets of attributes are part of the Get-Printer-Attributes Request:

#### 1650 Group 1: Operation Attributes

##### 1651 Natural Language and Character Set:

1652 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

##### 1653 Target:

1654 The "printer-uri" (uri) operation attribute which is the target for this operation as described in  
1655 section 3.1.5.

##### 1656 Requesting User Name:

1657 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as  
1658 described in section 1.1.

##### 1659 "requested-attributes" (1setOf keyword) :

1660 The client OPTIONALLY supplies a set of attribute names and/or attribute group names in whose  
1661 values the requester is interested. The Printer object MUST support this attribute. If the client  
1662 omits this attribute, the Printer MUST respond as if this attribute had been supplied with a value of  
1663 'all'.

##### 1664 "document-format" (mimeMediaType) :

1665 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute.  
1666 This attribute is useful for a Printer object to determine the set of supported attribute values that  
1667 relate to the requested document format. The Printer object MUST return the attributes and values  
1668 that it uses to validate a job on a create or Validate-Job operation in which this document format is  
1669 supplied. The Printer object SHOULD return only (1) those attributes that are supported for the  
1670 specified format and (2) the attribute values that are supported for the specified document format.  
1671 By specifying the document format, the client can get the Printer object to eliminate the attributes

1676 and values that are not supported for a specific document format. For example, a Printer object  
1677 might have multiple interpreters to support both 'application/postscript' (for PostScript) and  
1678 'text/plain' (for text) documents. However, for only one of those interpreters might the Printer  
1679 object be able to support "number-up" with values of '1', '2', and '4'. For the other interpreter it  
1680 might be able to only support "number-up" with a value of '1'. Thus a client can use the Get-Printer-  
1681 Attributes operation to obtain the attributes and values that will be used to accept/reject a create job  
1682 operation.

1683  
1684 If the Printer object does not distinguish between different sets of supported values for each  
1685 different document format when validating jobs in the create and Validate-Job operations, it MUST  
1686 NOT distinguish between different document formats in the Get-Printer-Attributes operation. If the  
1687 Printer object does distinguish between different sets of supported values for each different  
1688 document format specified by the client, this specialization applies only to the following Printer  
1689 object attributes:

- 1690
- 1691 - Printer attributes that are Job Template attributes ("xxx-default" "xxx-supported", and "xxx-  
1692 ready" in the Table in Section 4.2),
- 1693 - "pdl-override-supported",
- 1694 - "compression-supported",
- 1695 - "job-k-octets-supported",
- 1696 - "job-impressions-supported",
- 1697 - "job-media-sheets-supported"
- 1698 - "printer-driver-installer",
- 1699 - "color-supported", and
- 1700 - "reference-uri-schemes-supported"
- 1701

1702 The values of all other Printer object attributes (including "document-format-supported") remain  
1703 invariant with respect to the client supplied document format (except for new Printer description  
1704 attribute as registered according to section 6.2).

1705  
1706 If the client omits this "document-format" operation attribute, the Printer object MUST respond as if  
1707 the attribute had been supplied with the value of the Printer object's "document-format-default"  
1708 attribute. It is recommended that the client always supply a value for "document-format", since the  
1709 Printer object's "document-format-default" may be 'application/octet-stream', in which case the  
1710 returned attributes and values are for the union of the document formats that the Printer can  
1711 automatically sense. For more details, see the description of the 'mimeMediaType' attribute syntax  
1712 in section 4.1.9.

1713  
1714 If the client supplies a value for the "document-format" Operation attribute that is not supported by  
1715 the Printer, i.e., is not among the values of the Printer object's "document-format-supported"  
1716 attribute, the Printer object MUST reject the operation and return the 'client-error-document-format-  
1717 not-supported' status code.

1718

1719 3.2.5.2 Get-Printer-Attributes Response

1720 The Printer object returns the following sets of attributes as part of the Get-Printer-Attributes Response:

1721 Group 1: Operation Attributes

1722 Status Message:

1723 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY  
1724 includes a "status-message" (text(255)) and/or a "detailed-status-message" (text(MAX)) operation  
1725 attribute as described in sections 13 and 3.1.6.

1727 Natural Language and Character Set:

1728 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.

1730 Group 2: Unsupported Attributes

1731 See section 3.1.7 for details on returning Unsupported Attributes.

1732 ~~This is a set of Operation attributes supplied by the client (in the request) that are not supported by~~  
1733 ~~the Printer object or that conflict with one another (see sections 3.2.1.2 and 16).~~ The response  
1734 NEED NOT contain the "requested-attributes" operation attribute with any supplied values (attribute  
1735 keywords) that were requested by the client but are not supported by the IPP object. If the Printer  
1736 object ~~is not returning any Unsupported Attributes in the response, the Printer object SHOULD omit~~  
1737 ~~Group 2 rather than sending an empty group. However, a client MUST be able to accept an empty~~  
1738 ~~group.~~ does include unsupported attributes referenced in "requested-attributes" and such attributes  
1739 include group names, such as 'all', the unsupported attributes MUST NOT include attributes  
1740 described in the standard but not supported by the implementation.

1743 Group 3: Printer Object Attributes

1744 This is the set of requested attributes and their current values. The Printer object ignores (does not  
1745 respond with) any requested attribute which is not supported. The Printer object MAY respond with  
1746 a subset of the supported attributes and values, depending on the security policy in force. However,  
1747 the Printer object MUST respond with the 'unknown' value for any supported attribute (including all  
1748 REQUIRED attributes) for which the Printer object does not know the value. Also the Printer  
1749 object MUST respond with the 'no-value' for any supported attribute (including all REQUIRED  
1750 attributes) for which the system administrator has not configured a value. See the description of the  
1751 "out-of-band" values in the beginning of Section 4.1.

1753 3.2.6 Get-Jobs Operation

1754 This REQUIRED operation allows a client to retrieve the list of Job objects belonging to the target Printer  
1755 object. The client may also supply a list of Job attribute names and/or attribute group names. A group of  
1756 Job object attributes will be returned for each Job object that is returned.

1757 This operation is similar to the Get-Job-Attributes operation, except that this Get-Jobs operation returns  
1758 attributes from possibly more than one object (see the description of Job attribute group names in section  
1759 3.3.4).

### 1760 3.2.6.1 Get-Jobs Request

1761 The client submits the Get-Jobs request to a Printer object.

1762 The following groups of attributes are part of the Get-Jobs Request:

#### 1763 Group 1: Operation Attributes

1764 Natural Language and Character Set:

1765 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

1766

1767 Target:

1768 The "printer-uri" (uri) operation attribute which is the target for this operation as described in  
1769 section 3.1.5.

1770

1771 Requesting User Name:

1772 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as  
1773 described in section 1.1.

1774

1775 "limit" (integer(1:MAX)):

1776 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It  
1777 is an integer value that indicates a limit to the number of Job objectsdetermines the maximum  
1778 number of jobs that a client will receive from the Printer even if "which-jobs" or "my-jobs"  
1779 constrain which jobs are returned. The limit is a "stateless limit" in that if the value supplied by the  
1780 client is 'N', then only the first 'N' jobs are returned in the Get-Jobs Response. There is no  
1781 mechanism to allow for the next 'M' jobs after the first 'N' jobs. If the client does not supply this  
1782 attribute, the Printer object responds with all applicable jobs.

1783

1784 "requested-attributes" (1setOf keyword):

1785 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It  
1786 is a set of Job attribute names and/or attribute groups names in whose values the requester is  
1787 interested. This set of attributes is returned for each Job object that is returned. The allowed  
1788 attribute group names are the same as those defined in the Get-Job-Attributes operation in section  
1789 3.3.4. If the client does not supply this attribute, the Printer MUST respond as if the client had  
1790 supplied this attribute with two values: 'job-uri' and 'job-id'.

1791

1792 "which-jobs" (keyword):

1793 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It  
1794 indicates which Job objects MUST be returned by the Printer object. The values for this attribute  
1795 are:

1796

1797 'completed': This includes any Job object whose state is 'completed', 'canceled', or 'aborted'.

1798 'not-completed': This includes any Job object whose state is 'pending', 'processing', 'processing-  
1799 stopped', or 'pending-held'.  
1800

1801 A Printer object MUST support both values. However, if the implementation does not keep jobs in  
1802 the 'completed', 'canceled', and 'aborted' states, then it returns no jobs when the 'completed' value is  
1803 supplied.  
1804

1805 If a client supplies some other value, the Printer object MUST copy the attribute and the  
1806 unsupported value to the Unsupported Attributes response group, reject the request, and return the  
1807 'client-error-attributes-or-values-not-supported' status code.  
1808

1809 If the client does not supply this attribute, the Printer object MUST respond as if the client had  
1810 supplied the attribute with a value of 'not-completed'.  
1811

1812 "my-jobs" (boolean):

1813 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It  
1814 indicates whether ~~all~~ jobs from all users or just the jobs submitted by the requesting user of this  
1815 request MUST be returned by the Printer object. If the client does not supply this attribute, the  
1816 Printer object MUST respond as if the client had supplied the attribute with a value of 'false', i.e., ~~all~~  
1817 jobs:jobs from all users. The means for authenticating the requesting user and matching the jobs is  
1818 described in section 8.

### 1819 3.2.6.2 Get-Jobs Response

1820 The Printer object returns all of the Job objects up to the number specified by the "limit" attribute that  
1821 match the criteria as defined by the attribute values supplied by the client in the request. It is possible that  
1822 no Job objects are returned since there may literally be no Job objects at the Printer, or there may be no Job  
1823 objects that match the criteria supplied by the client. If the client requests any Job attributes at all, there is a  
1824 set of Job Object Attributes returned for each Job object.

1825 It is not an error for the Printer to return 0 jobs. If the response returns 0 jobs because there are no jobs  
1826 matching the criteria, and the request would have returned 1 or more jobs with a status code of 'successful-  
1827 ok' if there had been jobs matching the criteria, then the status code for 0 jobs MUST be 'successful-ok'.

#### 1828 Group 1: Operation Attributes

1829 Status Message:

1830 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY  
1831 includes a "status-message" (text(255)) and/or a "detailed-status-message" (text(MAX)) operation  
1832 attribute as described in sections 13 and 3.1.6.  
1833

1834 Natural Language and Character Set:

1835 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.  
1836

#### 1837 Group 2: Unsupported Attributes

1838 See section 3.1.7 for details on returning Unsupported Attributes.

1839  
1840 ~~This is a set of Operation attributes supplied by the client (in the request) that are not supported by~~  
1841 ~~the Printer object or that conflict with one another (see sections 3.2.1.2 and the Implementer's Guide~~  
1842 ~~[IPP-IG]).~~ The response NEED NOT contain the "requested-attributes" operation attribute with  
1843 any supplied values (attribute keywords) that were requested by the client but are not supported by  
1844 the IPP object. If the Printer object ~~is not returning any Unsupported Attributes in the response, the~~  
1845 ~~Printer object SHOULD omit Group 2 rather than sending an empty group. However, a client~~  
1846 ~~MUST be able to accept an empty group.~~ does include unsupported attributes referenced in  
1847 "requested-attributes" and such attributes include group names, such as 'all', the unsupported  
1848 attributes MUST NOT include attributes described in the standard but not supported by the  
1849 implementation.

### 1851 Groups 3 to N: Job Object Attributes

1852 The Printer object responds with one set of Job Object Attributes for each returned Job object. The  
1853 Printer object ignores (does not respond with) any requested attribute or value which is not  
1854 supported or which is restricted by the security policy in force, including whether the requesting  
1855 user is the user that submitted the job (job originating user) or not (see section 8). However, the  
1856 Printer object MUST respond with the 'unknown' value for any supported attribute (including all  
1857 REQUIRED attributes) for which the Printer object does not know the value, unless it would violate  
1858 the security policy. See the description of the "out-of-band" values in the beginning of Section 4.1.

1859  
1860 Jobs are returned in the following order:

- 1861 - If the client requests all 'completed' Jobs (Jobs in the 'completed', 'aborted', or 'canceled' states),
- 1862 then the Jobs are returned newest to oldest (with respect to actual completion time)
- 1863 - If the client requests all 'not-completed' Jobs (Jobs in the 'pending', 'processing', 'pending-held',
- 1864 and 'processing-stopped' states), then Jobs are returned in relative chronological order of
- 1865 expected time to complete (based on whatever scheduling algorithm is configured for the
- 1866 Printer object).

### 1867 3.2.7 Pause-Printer Operation

1868 This OPTIONAL operation allows a client to stop the Printer object from scheduling jobs on all its devices.  
1869 Depending on implementation, the Pause-Printer operation MAY also stop the Printer from processing the  
1870 current job or jobs. Any job that is currently being printed is either stopped as soon as the implementation  
1871 permits or is completed, depending on implementation. The Printer object MUST still accept create  
1872 operations to create new jobs, but MUST prevent any jobs from entering the 'processing' state.

1873 If the Pause-Printer operation is supported, then the Resume-Printer operation MUST be supported, and  
1874 vice-versa.

1875 The IPP Printer stops the current job(s) on its device(s) that were in the 'processing' or 'processing-stopped'  
1876 states as soon as the implementation permits. If the implementation will take appreciable time to stop, the  
1877 IPP Printer adds the 'moving-to-paused' value to the Printer object's "printer-state-reasons" attribute (see

1878 section 4.4.12). When the device(s) have all stopped, the IPP Printer transitions the Printer object to the  
1879 'stopped' state, removes the 'moving-to-paused' value, if present, and adds the 'paused' value to the Printer  
1880 object's "printer-state-reasons" attribute.

1881 When the current job(s) complete that were in the 'processing' state, the IPP Printer transitions them to the  
1882 'completed' state. When the current job(s) stop in mid processing that were in the 'processing' state, the IPP  
1883 Printer transitions them to the 'processing-stopped' state and adds the 'printer-stopped' value to the job's  
1884 "job-state-reasons" attribute.

1885 For any jobs that are 'pending' or 'pending-held', the 'printer-stopped' value of the jobs' "job-state-reasons"  
1886 attribute also applies. However, the IPP Printer NEED NOT update those jobs' "job-state-reasons"  
1887 attributes and only need return the 'printer-stopped' value when those jobs are queried (so-called "lazy  
1888 evaluation").

1889 Whether the Pause-Printer operation affects jobs that were submitted to the device from other sources than  
1890 the IPP Printer object in the same way that the Pause-Printer operation affects jobs that were submitted to  
1891 the IPP Printer object using IPP, depends on implementation, i.e., on whether the IPP protocol is being used  
1892 as a universal management protocol or just to manage IPP jobs, respectively.

1893 The IPP Printer MUST accept the request in any state and transition the Printer to the indicated new  
1894 "printer-state" before returning as follows:

<u>Current</u> <u>"printer-state"</u>	<u>New</u> <u>"printer-state"</u>	<u>"printer-</u> <u>state-</u> <u>reasons"</u>	<u>IPP Printer's response status code and action:</u>
<u>'idle'</u>	<u>'stopped'</u>	<u>'paused'</u>	<u>'successful-ok'</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'moving-to-</u> <u>paused'</u>	<u>OPTION 1: 'successful-ok';</u> <u>Later, when all output has stopped, the "printer-</u> <u>state" becomes 'stopped', and the 'paused' value</u> <u>replaces the 'moving-to-paused' value in the</u> <u>"printer-state-reasons" attribute</u>
<u>'processing'</u>	<u>'stopped'</u>	<u>'paused'</u>	<u>OPTION 2: 'successful-ok';</u> <u>all device output stopped immediately</u>
<u>'stopped'</u>	<u>'stopped'</u>	<u>'paused'</u>	<u>'successful-ok'</u>

1895 Access Rights: The authenticated user (see section 1.1) performing this operation must be an operator or  
1896 administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP Printer MUST reject the  
1897 operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or 'client-error-not-authorized'  
1898 as appropriate.

1899 3.2.7.1 Pause-Printer Request

1900 The following groups of attributes are part of the Pause-Printer Request:

1901 Group 1: Operation Attributes

1902 Natural Language and Character Set:

1903 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.  
1904

1905 Target:

1906 The "printer-uri" (uri) operation attribute which is the target for this operation as described in  
1907 section 3.1.5.

1908  
1909 Requesting User Name:

1910 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as  
1911 described in section 1.1.

1912 3.2.7.2 Pause-Printer Response

1913 The following groups of attributes are part of the Pause-Printer Response:

1914 Group 1: Operation Attributes

1915 Status Message:

1916 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY  
1917 includes a "status-message" (text(255)) and/or a "detailed-status-message" (text(MAX)) operation  
1918 attribute as described in sections 13 and 3.1.6.

1919  
1920 Natural Language and Character Set:

1921 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.  
1922

1923 Group 2: Unsupported Attributes

1924 See section 3.1.7 for details on returning Unsupported Attributes.  
1925

1926 3.2.8 Resume-Printer Operation

1927 This operation allows a client to resume the Printer object scheduling jobs on all its devices. The Printer  
1928 object MUST remove the 'paused' and 'moving-to-paused' values from the Printer object's "printer-state-  
1929 reasons" attribute, if present. If there are no other reasons to keep a device paused (such as media-jam), the  
1930 IPP Printer transitions itself to the 'processing' or 'idle' states, depending on whether there are jobs to be  
1931 processed or not, respectively, and the device(s) resume processing jobs.

1932 If the Pause-Printer operation is supported, then the Resume-Printer operation MUST be supported, and  
1933 vice-versa.

1934 The IPP Printer removes the 'printer-stopped' value from any job's "job-state-reasons" attributes contained  
1935 in that Printer.

1936 The IPP Printer MUST accept the request in any state, transition the Printer object to the indicated new state  
1937 as follows:

<u>Current</u> <u>"printer-state"</u>	<u>New "printer-state"</u>	<u>IPP Printer's response status code and action:</u>
<u>'idle'</u>	<u>'idle'</u>	<u>'successful-ok'</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'successful-ok'</u>
<u>'stopped'</u>	<u>'processing'</u>	<u>'successful-ok';</u> <u>when there are jobs to be processed</u>
<u>'stopped'</u>	<u>'idle'</u>	<u>'successful-ok';</u> <u>when there are no jobs to be processed.</u>

1938 Access Rights: The authenticated user (see section 1.1) performing this operation must be an operator or  
 1939 administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP Printer MUST reject the  
 1940 operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or 'client-error-not-authorized'  
 1941 as appropriate.

1942 The Resume-Printer Request and Resume-Printer Response have the same attribute groups and attributes as  
 1943 the Pause-Printer operation (see sections 3.2.7.1 and 3.2.7.2).

1944 3.2.9 Purge-Jobs Operation

1945 This OPTIONAL operation allows a client to remove all jobs from an IPP Printer object, regardless of their  
 1946 job states, including jobs in the Printer object's Job History (see Section 4.3.7.2). After a Purge-Jobs  
 1947 operation has been performed, a Printer object MUST return no jobs in subsequent Get-Job-Attributes and  
 1948 Get-Jobs responses (until new jobs are submitted).

1949 Whether the Purge-Jobs (and Get-Jobs) operation affects jobs that were submitted to the device from other  
 1950 sources than the IPP Printer object in the same way that the Purge-Jobs operation affects jobs that were  
 1951 submitted to the IPP Printer object using IPP, depends on implementation, i.e., on whether the IPP protocol  
 1952 is being used as a universal management protocol or just to manage IPP jobs, respectively.

1953 Note: if an operator wants to cancel all jobs without clearing out the Job History, the operator uses the  
 1954 Cancel-Job operation on each job instead of using the Purge-Job operation.

1955 The Printer object MUST accept this operation in any state and transition the Printer object to the 'idle'  
 1956 state.

1957 Access Rights: The authenticated user (see section 1.1) performing this operation must be an operator or  
 1958 administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP object MUST reject the  
 1959 operation and return: client-error-forbidden, client-error-not-authenticated, and client-error-not-authorized  
 1960 as appropriate.

1961 The Purge-Jobs Request and Purge-Jobs Response have the same attribute groups and attributes as the  
 1962 Pause-Printer operation (see sections 3.2.7.1 and 3.2.7.2).

1963

1964 3.3 Job Operations

1965 All Job operations are directed at Job objects. A client MUST always supply some means of identifying the  
1966 Job object in order to identify the correct target of the operation. That job identification MAY either be a  
1967 single Job URI or a combination of a Printer URI with a Job ID. The IPP object implementation MUST  
1968 support both forms of identification for every job.

1969 3.3.1 Send-Document Operation

1970 This OPTIONAL operation allows a client to create a multi-document Job object that is initially "empty"  
1971 (contains no documents). In the Create-Job response, the Printer object returns the Job object's URI (the  
1972 "job-uri" attribute) and the Job object's 32-bit identifier (the "job-id" attribute). For each new document  
1973 that the client desires to add, the client uses a Send-Document operation. Each Send-Document Request  
1974 contains the entire stream of document data for one document.

1975 If the Printer supports this operation but does not support multiple documents per job, the Printer MUST  
1976 reject subsequent Send-Document operations supplied with data and return the 'server-error-multiple-  
1977 document-jobs-not-supported'. However, the Printer MUST accept the first document with a 'true' or 'false'  
1978 value for the "last-document" operation attribute (see below), so that clients MAY always submit one  
1979 document jobs with a 'false' value for "last-document" in the first Send-Document and a 'true' for "last-  
1980 document" in the second Send-Document (with no data).

1981 Since the Create-Job and the send operations (Send-Document or Send-URI operations) that follow could  
1982 occur over an arbitrarily long period of time for a particular job, a client MUST send another send operation  
1983 within an IPP Printer defined minimum time interval after the receipt of the previous request for the job. If  
1984 a Printer object supports multiple document jobs, the Printer object MUST support the "multiple-operation-  
1985 time-out" attribute (see section 4.4.31). This attribute indicates the minimum number of seconds the Printer  
1986 object will wait for the next send operation before taking some recovery action.

1987 An IPP object MUST recover from an errant client that does not supply a send operation, sometime after  
1988 the minimum time interval specified by the Printer object's "multiple-operation-time-out" attribute. Such  
1989 recovery MAY include any of the following or other recovery actions:

- 1990 1. Assume that the Job is an invalid job, start the process of changing the job state to 'aborted', add the  
1991 'aborted-by-system' value to the job's "job-state-reasons" attribute (see section 4.3.8), ~~if supported,~~  
1992 and clean up all resources associated with the Job. In this case, if another send operation is finally  
1993 received, the Printer responds with an "client-error-not-possible" or "client-error-not-found"  
1994 depending on whether or not the Job object is still around when the send operation finally arrives.
- 1995 2. Assume that the last send operation received was in fact the last document (as if the "last-document"  
1996 flag had been set to 'true'), close the Job object, and proceed to process it (i.e., move the Job's state  
1997 to 'pending').
- 1998 3. Assume that the last send operation received was in fact the last document, close the Job, but move it  
1999 to the 'pending-held' and add the 'submission-interrupted' value to the job's "job-state-reasons"  
2000 attribute (see section 4.3.8), ~~if supported.~~ This action allows the user or an operator to determine  
2001 whether to continue processing the Job by moving it back to the 'pending' state using the Release-

Job operation (see section 3.3.6) or to cancel the job using the Cancel-Job operation (see section 3.3.3).

Each implementation is free to decide the "best" action to take depending on local policy, whether any documents have been added, whether the implementation spools jobs or not, and/or any other piece of information available to it. If the choice is to abort the Job object, it is possible that the Job object may already have been processed to the point that some media sheet pages have been printed.

Access Rights: The authenticated user (see section 1.1) performing this operation must either be the job owner (as determined in the Create-Job operation) or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or 'client-error-not-authorized' as appropriate.

### 3.3.1.1 Send-Document Request

The following attribute sets are part of the Send-Document Request:

#### Group 1: Operation Attributes

Natural Language and Character Set:

The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

Target:

Either (1) the "printer-uri" (uri) plus "job-id" (integer(1:MAX)) or (2) the "job-uri" (uri) operation attribute(s) which define the target for this operation as described in section 3.1.5.

Requesting User Name:

The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as described in section 1.1.

"document-name" (name(MAX)):

The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It contains the client supplied document name. The document name MAY be different than the Job name. It might be helpful, but NEED NOT be unique across multiple documents in the same Job. Typically, the client software automatically supplies the document name on behalf of the end user by using a file name or an application generated name. See the description of the "document-name" operation attribute in the Print-Job Request (section 3.2.1.1) for more information about this attribute.

"compression" (type3 keyword)

See the description of "compression" for the Print-Job operation in Section 3.2.1.1.

"document-format" (mimeMediaType) :

~~The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. The value of this attribute identifies the format of the supplied document data. If the client does not~~

2042 ~~supply this attribute, the Printer object assumes that the document data is in the format defined by~~  
2043 ~~the Printer object's "document-format-default" attribute. If the client supplies this attribute, but the~~  
2044 ~~value is not supported by the Printer object, i.e., the value is not one of the values of the Printer~~  
2045 ~~object's "document-format-supported" attribute, the Printer object MUST reject the request and~~  
2046 ~~return the 'client-error-document-format-not-supported' status code. See the description of~~  
2047 ~~"document-format" for the Print-Job operation in Section 3.2.1.1.~~

2048  
2049 "document-natural-language" (naturalLanguage):

2050 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this  
2051 attribute. This attribute specifies the natural language of the document for those document-formats  
2052 that require a specification of the natural language in order to image the document unambiguously.  
2053 There are no particular values required for the Printer object to support.

2054  
2055 "~~compression" (type3 keyword)~~

2056 ~~The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this~~  
2057 ~~attribute and the "compression-supported" attribute (see section 4.4.29). The client supplied~~  
2058 ~~"compression" operation attribute identifies the compression algorithm used on the document data.~~  
2059 ~~If the client omits this attribute, the Printer object MUST assume that the data is not compressed. If~~  
2060 ~~the client supplies the attribute and the Printer object supports the attribute, the Printer object MUST~~  
2061 ~~use the corresponding decompression algorithm on the document data. If the client supplies this~~  
2062 ~~attribute, but the value is not supported by the Printer object, i.e., the value is not one of the values~~  
2063 ~~of the Printer object's "compression-supported" attribute, the Printer object MUST copy the attribute~~  
2064 ~~and its value to the Unsupported Attributes response group, reject the request, and return the 'client-~~  
2065 ~~error-attributes-or-values-not-supported' status code.~~

2066  
2067 "last-document" (boolean):

2068 The client MUST supply this attribute. The Printer object MUST support this attribute. It is a  
2069 boolean flag that is set to 'true' if this is the last document for the Job, 'false' otherwise.

## 2070 2071 Group 2: Document Content

2072 The client MUST supply the document data if the "last-document" flag is set to 'false'. However,  
2073 since a client might not know that the previous document sent with a Send-Document (or Send-  
2074 URI) operation was the last document (i.e., the "last-document" attribute was set to 'false'), it is legal  
2075 to send a Send-Document request with no document data where the "last-document" flag is set to  
2076 'true'. Such a request MUST NOT increment the value of the Job object's "number-of-documents"  
2077 attribute, since no real document was added to the job.

### 2078 3.3.1.2 Send-Document Response

2079 The following sets of attributes are part of the Send-Document Response:

#### 2080 Group 1: Operation Attributes

2081 Status Message:

2082 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY  
2083 includes a "status-message" (text(255)) and/or a "detailed-status-message" (text(MAX)) operation  
2084 attribute as described in sections 13 and 3.1.6.

2085  
2086 Natural Language and Character Set:

2087 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.  
2088

2089 Group 2: Unsupported Attributes

2090 ~~This is a set of Operation attributes supplied by the client (in the request) that are not supported by~~  
2091 ~~the Printer object or that conflict with one another (see sections 3.2.1.2 and the Implementer's Guide~~  
2092 ~~[IPP-IIG]). If the Printer object is not returning any Unsupported Attributes in the response, the~~  
2093 ~~Printer object SHOULD omit Group 2 rather than sending an empty group. However, a client~~  
2094 ~~MUST be able to accept an empty group. See section 3.1.7 for details on returning Unsupported~~  
2095 ~~Attributes.~~

2096 Group 3: Job Object Attributes

2097 This is the same set of attributes as described in the Print-Job response (see section 3.2.1.2).  
2098

2099 3.3.2 Send-URI Operation

2100 This OPTIONAL operation is identical to the Send-Document operation (see section 3.3.1) except that a  
2101 client MUST supply a URI reference ("document-uri" operation attribute) rather than the document data  
2102 itself. If a Printer object supports this operation, clients can use both Send-URI or Send-Document  
2103 operations to add new documents to an existing multi-document Job object. However, if a client needs to  
2104 indicate that the previous Send-URI or Send-Document was the last document, the client MUST use the  
2105 Send-Document operation with no document data and the "last-document" flag set to 'true' (rather than  
2106 using a Send-URI operation with no "document-uri" operation attribute).

2107 If a Printer object supports this operation, it MUST also support the Print-URI operation (see section 3.2.2).

2108 The Printer object MUST validate the syntax and URI scheme of the supplied URI before returning a  
2109 response, just as in the Print-URI operation. The IPP Printer MAY validate the accessibility of the  
2110 document as part of the operation or subsequently (see section 3.2.2).

2111 3.3.3 Cancel-Job Operation

2112 This REQUIRED operation allows a client to cancel a Print Job from the time the job is created up to the  
2113 time it is completed, canceled, or aborted. Since a Job might already be printing by the time a Cancel-Job is  
2114 received, some media sheet pages might be printed before the job is actually terminated.

2115 The IPP object MUST accept or reject the request based on the job's current state and transition the job to  
2116 the indicated new state as follows:

<u>Current "job-state"</u>	<u>New "job-state"</u>	<u>IPP object's response status code and action:</u>
<u>'pending'</u>	<u>'canceled'</u>	<u>'successful-ok'</u>
<u>'pending-held'</u>	<u>'canceled'</u>	<u>'successful-ok'</u>
<u>'processing'</u>	<u>'canceled'</u>	<u>'successful-ok'</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'successful-ok'</u> See Rule 1
<u>'processing'</u>	<u>'processing'</u>	<u>'client-error-not-possible'</u> See Rule 2
<u>'processing-stopped'</u>	<u>'canceled'</u>	<u>'successful-ok'</u>
<u>'processing-stopped'</u>	<u>'processing-stopped'</u>	<u>'successful-ok'</u> See Rule 1
<u>'processing-stopped'</u>	<u>'processing-stopped'</u>	<u>'client-error-not-possible'</u> See Rule 2
<u>'completed'</u>	<u>'completed'</u>	<u>'client-error-not-possible'</u>
<u>'canceled'</u>	<u>'canceled'</u>	<u>'client-error-not-possible'</u>
<u>'aborted'</u>	<u>'aborted'</u>	<u>'client-error-not-possible'</u>

2117 Rule 1: If the implementation requires some measurable time to cancel the job in the 'processing' or  
 2118 'processing-stopped' job states, the IPP object MUST add the 'processing-to-stop-point' value to the job's  
 2119 "job-state-reasons" attribute and then transition the job to the 'canceled' state when the processing ceases  
 2120 (see section 4.3.8).

2121 Rule 2: If the Job object already has the 'processing-to-stop-point' value in its "job-state-reasons" attribute,  
 2122 then the Printer object MUST reject a Cancel-Job operation.

2123 Access Rights: The authenticated user (see section 1.1) performing this operation must either be the job  
 2124 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP  
 2125 object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or  
 2126 'client-error-not-authorized' as appropriate.

2127 3.3.3.1 Cancel-Job Request

2128 The following groups of attributes are part of the Cancel-Job Request:

2129 Group 1: Operation Attributes

2130 Natural Language and Character Set:

2131 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

2132

2133 Target:

2134 Either (1) the "printer-uri" (uri) plus "job-id" (integer(1:MAX)) or (2) the "job-uri" (uri) operation  
 2135 attribute(s) which define the target for this operation as described in section 3.1.5.

2136

2137 Requesting User Name:

2138 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as  
 2139 described in section 1.1.

2140

2141 "message" (text(127)):

2142 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this  
2143 attribute. It is a message to the operator. This "message" attribute is not the same as the "job-  
2144 message-from-operator" attribute. That attribute is used to report a message from the operator to the  
2145 end user that queries that attribute. This "message" operation attribute is used to send a message  
2146 from the client to the operator along with the operation request. It is an implementation decision of  
2147 how or where to display this message to the operator (if at all).  
2148

### 2149 3.3.3.2 Cancel-Job Response

2150 The following sets of attributes are part of the Cancel-Job Response:

#### 2151 Group 1: Operation Attributes

##### 2152 Status Message:

2153 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY  
2154 includes a "status-message" (text(255)) and/or a "detailed-status-message" (text(MAX)) operation  
2155 attribute as described in sections 13 and 3.1.6.

2156  
2157 ~~If the job is already in the 'completed', 'aborted', or 'canceled' state, or the 'process-to-stop-point'~~  
2158 ~~value is set in the Job's "job-state-reasons" attribute, the Printer object MUST reject the request and~~  
2159 ~~return the 'client-error-not-possible' error status code.~~

##### 2160 Natural Language and Character Set:

2161 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.  
2162  
2163

#### 2164 Group 2: Unsupported Attributes

2165 ~~This is a set of Operation attributes supplied by the client (in the request) that are not supported by~~  
2166 ~~the Printer object or that conflict with one another (see section 3.2.1.2 and the Implementer's Guide~~  
2167 ~~[IPP-IIG]). If the Printer object is not returning any Unsupported Attributes in the response, the~~  
2168 ~~Printer object SHOULD omit Group 2 rather than sending an empty group. However, a client~~  
2169 ~~MUST be able to accept an empty group. See section 3.1.7 for details on returning Unsupported~~  
2170 ~~Attributes.~~

2171  
2172 Once a successful response has been sent, the implementation guarantees that the Job will eventually end up  
2173 in the 'canceled' state. Between the time of the Cancel-Job operation is accepted and when the job enters the  
2174 'canceled' job-state (see section 4.3.7), the "job-state-reasons" attribute SHOULD contain the ~~'processing-~~  
2175 ~~to-'~~processing-to-stop-stop-point-point value which indicates to later queries that although the Job might  
2176 still be 'processing', it will eventually end up in the 'canceled' state, not the 'completed' state.

2177 3.3.4 Get-Job-Attributes Operation

2178 This REQUIRED operation allows a client to request the values of attributes of a Job object and it is almost  
2179 identical to the Get-Printer-Attributes operation (see section 3.2.5). The only differences are that the  
2180 operation is directed at a Job object rather than a Printer object, there is no "document-format" operation  
2181 attribute used when querying a Job object, and the returned attribute group is a set of Job object attributes  
2182 rather than a set of Printer object attributes.

2183 For Jobs, the possible names of attribute groups are:

- 2184 - 'job-template': all the subset of the Job Template attributes that apply to a Job object (the first column  
2185 of the table in Section 4.2) that the implementation supports for Job objects.
- 2186 - 'job-description': all the subset of the Job Description attributes specified in Section 4.3 that the  
2187 implementation supports for Job objects.
- 2188 - 'all': the special group 'all' that includes all ~~supported attributes~~ attributes that the implementation  
2189 supports for Job objects.

2191 Since a client MAY request specific attributes or named groups, there is a potential that there is some  
2192 overlap. For example, if a client requests, 'job-name' and 'job-description', the client is actually requesting  
2193 the "job-name" attribute once by naming it explicitly, and once by inclusion in the 'job-description' group.  
2194 In such cases, the Printer object NEED NOT return the attribute only once in the response even if it is  
2195 requested multiple times. The client SHOULD NOT request the same attribute in multiple ways.

2196 It is NOT REQUIRED that a Job object support all attributes belonging to a group (since some attributes  
2197 are OPTIONAL). However it is REQUIRED that each Job object support all group names.

2198 3.3.4.1 Get-Job-Attributes Request

2199 The following groups of attributes are part of the Get-Job-Attributes Request when the request is directed at  
2200 a Job object:

2201 Group 1: Operation Attributes

2202 Natural Language and Character Set:

2203 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

2204

2205 Target:

2206 Either (1) the "printer-uri" (uri) plus "job-id" (integer(1:MAX)) or (2) the "job-uri" (uri) operation  
2207 attribute(s) which define the target for this operation as described in section 3.1.5.

2208

2209 Requesting User Name:

2210 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as  
2211 described in section 1.1.

2212

2213 "requested-attributes" (1setOf keyword) :

2214 The client OPTIONALLY supplies this attribute. The IPP object MUST support this attribute. It is  
2215 a set of attribute names and/or attribute group names in whose values the requester is interested. If  
2216 the client omits this attribute, the IPP object MUST respond as if this attribute had been supplied  
2217 with a value of 'all'.  
2218

#### 2219 3.3.4.2 Get-Job-Attributes Response

2220 The Printer object returns the following sets of attributes as part of the Get-Job-Attributes Response:

##### 2221 Group 1: Operation Attributes

2222 Status Message:

2223 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY  
2224 includes a "status-message" (text(255)) and/or a "detailed-status-message" (text(MAX)) operation  
2225 attribute as described in sections 13 and 3.1.6.  
2226

2227 Natural Language and Character Set:

2228 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.  
2229 The "attributes-natural-language" MAY be the natural language of the Job object, rather than the  
2230 one requested.  
2231

##### 2232 Group 2: Unsupported Attributes

2233 See section 3.1.7 for details on returning Unsupported Attributes.

2234  
2235 ~~This is a set of Operation attributes supplied by the client (in the request) that are not supported by~~  
2236 ~~the Printer object or that conflict with one another (see sections 3.2.1.2 and the Implementer's Guide~~  
2237 ~~[IPP-IG]). The response NEED NOT contain the "requested-attributes" operation attribute with~~  
2238 ~~any supplied values (attribute keywords) that were requested by the client but are not supported by~~  
2239 ~~the IPP object. If the Printer object is not returning any Unsupported Attributes in the response, the~~  
2240 ~~Printer object SHOULD omit Group 2 rather than sending an empty group. However, a client~~  
2241 ~~MUST be able to accept an empty group.~~ does include unsupported attributes referenced in  
2242 "requested-attributes" and such attributes include group names, such as 'all', the unsupported  
2243 attributes MUST NOT include attributes described in the standard but not supported by the  
2244 implementation.  
2245

##### 2246 Group 3: Job Object Attributes

2247 This is the set of requested attributes and their current values. The IPP object ignores (does not  
2248 respond with) any requested attribute or value which is not supported or which is restricted by the  
2249 security policy in force, including whether the requesting user is the user that submitted the job (job  
2250 originating user) or not (see section 8). However, the IPP object MUST respond with the 'unknown'  
2251 value for any supported attribute (including all REQUIRED attributes) for which the IPP object does

2252 not know the value, unless it would violate the security policy. See the description of the "out-of-  
2253 band" values in the beginning of Section 4.1.

2254 3.3.5 Hold-Job Operation

2255 This OPTIONAL operation allows a client to hold a pending job in the queue so that it is not eligible for  
2256 scheduling. If the Hold-Job operation is supported, then the Release-Job operation MUST be supported,  
2257 and vice-versa. The OPTIONAL "job-hold-until" operation attribute allows a client to specify whether to  
2258 hold the job indefinitely or until a specified time period, if supported.

2259 The IPP object MUST accept or reject the request based on the job's current state and transition the job to  
2260 the indicated new state as follows:

<u>Current "job-state"</u>	<u>New "job-state"</u>	<u>IPP object's response status code and action:</u>
<u>'pending'</u>	<u>'pending-held'</u>	<u>'successful-ok' See Rule 1</u>
<u>'pending'</u>	<u>'pending'</u>	<u>'successful-ok' See Rule 2</u>
<u>'pending-held'</u>	<u>'pending-held'</u>	<u>'successful-ok' See Rule 1</u>
<u>'pending-held'</u>	<u>'pending'</u>	<u>'successful-ok' See Rule 2</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'client-error-not-possible'</u>
<u>'processing-stopped'</u>	<u>'processing-stopped'</u>	<u>'client-error-not-possible'</u>
<u>'completed'</u>	<u>'completed'</u>	<u>'client-error-not-possible'</u>
<u>'canceled'</u>	<u>'canceled'</u>	<u>'client-error-not-possible'</u>
<u>'aborted'</u>	<u>'aborted'</u>	<u>'client-error-not-possible'</u>

2261 Rule 1: If the implementation supports multiple reasons for a job to be in the 'pending-held' state, the IPP  
2262 object MUST add the 'job-hold-until-specified' value to the job's "job-state-reasons" attribute.

2263 Rule 2: If the IPP object supports the "job-hold-until" operation attribute, but the specified time period has  
2264 already started (or is the 'no-hold' value) and there are no other reasons to hold the job, the IPP object  
2265 MUST make the job be a candidate for processing immediately (see Section 4.2.2) by putting the job in the  
2266 'pending' state.

2267 Note: In order to keep the Hold-Job operation simple, such a request is rejected when the job is in the  
2268 'processing' or 'processing-stopped' states. If an operation is needed to hold jobs while in these states, it will  
2269 be added as an additional operation, rather than overloading the Hold-Job operation. Then it is clear to  
2270 clients by querying the Printer object's "operations-supported" (see Section 4.4.15) and the Job object's  
2271 "job-state" (see Section 4.3.7) attributes which operations are possible.

2272 Access Rights: The authenticated user (see section 1.1) performing this operation must either be the job  
2273 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP  
2274 object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or  
2275 'client-error-not-authorized' as appropriate.

### 3.3.5.1 Hold-Job Request

The groups and operation attributes are the same as for a Cancel-Job request (see section 3.3.3.1), with the addition of the following Group 1 Operation attribute:

"job-hold-until" (type3 keyword | name(MAX)):

The client OPTIONALLY supplies this Operation attribute. The IPP object MUST support this operation attribute in a Hold-Job request, if it supports the "job-hold-until" Job template attribute in create operations. See section 4.2.2. The IPP object SHOULD support the "job-hold-until" Job Template attribute for use in job create operations with at least the 'indefinite' value, if it supports the Hold-Job operation. Otherwise, a client cannot create a job and hold it immediately (without picking some supported time period in the future).

If supplied and supported as specified in the Printer's "job-hold-until-supported" attribute, the IPP object copies the supplied operation attribute to the Job object, replacing the job's previous "job-hold-until" attribute, if present, and makes the job a candidate for scheduling during the supplied named time period.

If supplied, but either the "job-hold-until" Operation attribute itself or the value supplied is not supported, the IPP object accepts the request, returns the unsupported attribute or value in the Unsupported Attributes Group according to section 3.1.7, returns the 'successful-ok-ignored-or-substituted-attributes, and holds the job indefinitely until a client performs a subsequent Release-Job operation.

If the client (1) supplies a value that specifies a time period that has already started or the 'no-hold' value (meaning don't hold the job) and (2) the IPP object supports the "job-hold-until" operation attribute and there are no other reasons to hold the job, the IPP object MUST accept the operation and make the job be a candidate for processing immediately (see Section 4.2.2).

If the client does not supply a "job-hold-until" Operation attribute in the request, the IPP object MUST populate the job object with a "job-hold-until" attribute with the 'indefinite' value (if IPP object supports the "job-hold-until" attribute) and hold the job indefinitely, until a client performs a Release-Job operation.

### 3.3.5.2 Hold-Job Response

The groups and attributes are the same as for a Cancel-Job response (see section 3.3.3.2).

### 3.3.6 Release-Job Operation

This OPTIONAL operation allows a client to release a previously held job so that it is again eligible for scheduling. If the Hold-Job operation is supported, then the Release-Job operation MUST be supported, and vice-versa.

This operation removes the "job-hold-until" job attribute, if present, from the job object that had been supplied in the create or most recent Hold-Job or Restart-Job operation and removes its effect on the job.

2311 The IPP object MUST remove the 'job-hold-until-specified' value from the job's "job-state-reasons"  
2312 attribute, if present. See section 4.3.8.

2313 The IPP object MUST accept or reject the request based on the job's current state and transition the job to  
2314 the indicated new state as follows:

<u>Current "job-state"</u>	<u>New "job-state"</u>	<u>IPP object's response status code and action:</u>
<u>'pending'</u>	<u>'pending'</u>	<u>'successful-ok'</u> <u>No effect on the job.</u>
<u>'pending-held'</u>	<u>'pending-held'</u>	<u>'successful-ok'</u> See Rule 1
<u>'pending-held'</u>	<u>'pending'</u>	<u>'successful-ok'</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'successful-ok'</u>
<u>'processing-stopped'</u>	<u>'processing-stopped'</u>	<u>No effect on the job.</u>
<u>'completed'</u>	<u>'completed'</u>	<u>'successful-ok'</u>
<u>'canceled'</u>	<u>'canceled'</u>	<u>No effect on the job.</u>
<u>'aborted'</u>	<u>'aborted'</u>	<u>'client-error-not-possible'</u>
		<u>'client-error-not-possible'</u>
		<u>'client-error-not-possible'</u>

2315 Rule 1: If there are other reasons to keep the job in the 'pending-held' state, such as 'resources-are-not-  
2316 ready', the job remains in the 'pending-held' state. Thus the 'pending-held' state is not just for jobs that have  
2317 the 'job-hold-until' applied to them, but are for any reason to keep the job from being a candidate for  
2318 scheduling and processing, such as 'resources-are-not-ready'. See the "job-hold-until" attribute (section  
2319 4.2.2).

2320 Access Rights: The authenticated user (see section 1.1) performing this operation must either be the job  
2321 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP  
2322 object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or  
2323 'client-error-not-authorized' as appropriate.

2324 The Release-Job Request and Release-Job Response have the same attribute groups and attributes as the  
2325 Cancel-Job operation (see section 3.3.3.1 and 3.3.3.2).

### 2326 3.3.7 Restart-Job Operation

2327 This OPTIONAL operation allows a client to restart a job that is retained in the queue after processing has  
2328 completed (see section 4.3.7.2).

2329 The job is moved to the 'pending' job state and restarts at the beginning on the same IPP Printer object with  
2330 the same attribute values. The Job Description attributes that accumulate job progress, such as "job-  
2331 impressions-completed", "job-media-sheets-completed", and "job-k-octets-processed", MUST be reset to 0  
2332 so that they give an accurate record of the job from its restart point. The job object MUST continue to use  
2333 the same "job-uri" and "job-id" attribute values.

2334 Note: If in the future an operation is needed that does not reset the job progress attributes, then a new  
2335 operation will be defined which makes a copy of the job, assigns a new "job-uri" and "job-id" to the copy  
2336 and resets the job progress attributes in the new copy only.

The IPP object MUST accept or reject the request based on the job's current state, transition the job to the indicated new state as follows:

<u>Current "job-state"</u>	<u>New "job-state"</u>	<u>IPP object's response status code and action:</u>
<u>'pending'</u>	<u>'pending'</u>	<u>'client-error-not-possible'</u>
<u>'pending-held'</u>	<u>'pending-held'</u>	<u>'client-error-not-possible'</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'client-error-not-possible'</u>
<u>'processing-stopped'</u>	<u>'processing-stopped'</u>	<u>'client-error-not-possible'</u>
<u>'completed'</u>	<u>'pending'</u>	<u>'successful-ok' - job is started over.</u>
<u>'completed'</u>	<u>'completed'</u>	<u>'client-error-not-possible' - see Rule 1</u>
<u>'canceled'</u>	<u>'pending'</u>	<u>'successful-ok' - job is started over.</u>
<u>'canceled'</u>	<u>'canceled'</u>	<u>'client-error-not-possible' - see Rule 1</u>
<u>'aborted'</u>	<u>'pending'</u>	<u>'successful-ok' - job is started over.</u>
<u>'aborted'</u>	<u>'aborted'</u>	<u>'client-error-not-possible' - see Rule 1</u>

Rule 1: If the Job Retention Period has expired for the job in this state, then the IPP object rejects the operation. See section 4.3.7.2.

Note: In order to prevent a user from inadvertently restarting a job in the middle, the Restart-Job request is rejected when the job is in the 'processing' or 'processing-stopped' states. If in the future an operation is needed to hold or restart jobs while in these states, it will be added as an additional operation, rather than overloading the Restart-Job operation, so that it is clear that the user intended that the current job not be completed.

Access Rights: The authenticated user (see section 1.1) performing this operation must either be the job owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or 'client-error-not-authorized' as appropriate.

### 3.3.7.1 Restart-Job Request

The groups and attributes are the same as for a Cancel-Job request (see section 3.3.3.1), with the addition of the following Group 1 Operation attribute:

"job-hold-until" (type3 keyword | name(MAX)):

The client OPTIONALLY supplies this attribute. The IPP object MUST support this Operation attribute in a Restart-Job request, if it supports the "job-hold-until" Job Template attribute in create operations. See section 4.2.2. Otherwise, the IPP object NEED NOT support the "job-hold-until" Operation attribute in a Restart-Job request.

If supplied and supported as specified in the Printer's "job-hold-until-supported" attribute, the IPP object copies the supplied Operation attribute to the Job object, replacing the job's previous "job-hold-until" attribute, if present, and makes the job a candidate for scheduling during the supplied named time period. See section 4.2.2.

If supplied, but the value is not supported, the IPP object accepts the request, returns the unsupported attribute or value in the Unsupported Attributes Group according to section 3.1.7.

2365 returns the 'successful-ok-ignored-or-substituted-attributes' status code, and holds the job  
2366 indefinitely until a client performs a subsequent Release-Job operation.

2367 If supplied, but the "job-hold-until" Operation attribute itself is not supported, the IPP object accepts  
2368 the request, returns the unsupported attribute with the out-of-band 'unsupported' value in the  
2369 Unsupported Attributes Group according to section 3.1.7, returns the 'successful-ok-ignored-or-  
2370 substituted-attributes' status code, and restarts the job, i.e., ignores the "job-hold-until" attribute.

2371 If the client (1) supplies a value that specifies a time period that has already started or the 'no-hold'  
2372 value (meaning don't hold the job) and (2) the IPP object supports the "job-hold-until" operation  
2373 attribute and there are no other reasons to hold the job, the IPP object makes the job a candidate for  
2374 processing immediately (see Section 4.2.2).

2375 If the client does not supply a "job-hold-until" operation attribute in the request, the IPP object  
2376 removes the "job-hold-until" attribute, if present, from the job. If there are no other reasons to hold  
2377 the job, the Restart-Job operation makes the job a candidate for processing immediately (see Section  
2378 4.2.2).

### 2379 3.3.7.2 Restart-Job Response

2380 The groups and attributes are the same as for a Cancel-Job response (see section 3.3.3.2).

2381 Note: In the future an OPTIONAL Modify-Job or Set-Job-Attributes operation may be specified that  
2382 allows the client to modify other attributes before releasing the restarted job.

## 2383 4. Object Attributes

2384 This section describes the attributes with their corresponding attribute syntaxes and values that are part of  
2385 the IPP model. The sections below show the objects and their associated attributes which are included  
2386 within the scope of this protocol. Many of these attributes are derived from other relevant  
2387 specifications:documents:

- 2388 - Document Printing Application (DPA) [ISO10175]
- 2389 - RFC 1759 Printer MIB [RFC1759]

2391 Each attribute is uniquely identified in this document using a "keyword" (see section 12.2.1) which is the  
2392 name of the attribute. The keyword is included in the section header describing that attribute.

2393 Note: Not only are keywords used to identify attributes, but one of the attribute syntaxes described below is  
2394 "keyword" so that some attributes have keyword values. Therefore, these attributes are defined as having  
2395 an attribute syntax that is a set of keywords.

2396 4.1 Attribute Syntaxes

2397 This section defines the basic attribute syntax types that all clients and IPP objects MUST be able to accept  
2398 in responses and accept in requests, respectively. Each attribute description in sections 3 and 4 includes the  
2399 name of attribute syntax(es) in the heading (in parentheses). A conforming implementation of an attribute  
2400 MUST include the semantics of the attribute syntax(es) so identified. Section 6.3 describes how the  
2401 protocol can be extended with new attribute syntaxes.

2402 The attribute syntaxes are specified in the following sub-sections, where the sub-section heading is the  
2403 keyword name of the attribute syntax inside the single quotes. In operation requests and responses each  
2404 attribute value MUST be represented as one of the attribute syntaxes specified in the sub-section heading  
2405 for the attribute. In addition, the value of an attribute in a response (but not in a request) MAY be one of  
2406 the "out-of-band" values whose special encoding rules are defined in the "Encoding and Transport"  
2407 document [IPP-PRO]. Standard "out-of-band" values are:

2408 'unknown': The attribute is supported by the IPP object, but the value is unknown to the IPP object for  
2409 some reason.

2410 'unsupported': The attribute is unsupported by the IPP object. This value MUST be returned only as the  
2411 value of an attribute in the Unsupported Attributes Group.

2412 'no-value': The attribute is supported by the Printer object, but the system administrator has not yet  
2413 configured a value.

2414

2415 ~~The Encoding and Transport specification [IPP-PRO] defines mechanisms for passing "out-of-band"~~  
2416 ~~values.~~ All attributes in a request MUST have one or more values as defined in Sections 4.2 to 4.4. Thus  
2417 clients MUST NOT supply attributes with "out-of-band" values. All attributes in a response MUST have  
2418 one or more values as defined in Sections 4.2 to 4.4 or a single "out-of-band" value.

2419 Most attributes are defined to have a single attribute syntax. However, a few attributes (e.g., "job-sheet",  
2420 "media", "job-hold-until") are defined to have several attribute syntaxes, depending on the value. These  
2421 multiple attribute syntaxes are separated by the "|" character in the sub-section heading to indicate the  
2422 choice. Since each value MUST be tagged as to its attribute syntax in the protocol, a single-valued attribute  
2423 instance may have any one of its attribute syntaxes and a multi-valued attribute instance may have a mixture  
2424 of its defined attribute syntaxes.

2425 4.1.1 'text'

2426 A text attribute is an attribute whose value is a sequence of zero or more characters encoded in a maximum  
2427 of 1023 ('MAX') octets. MAX is the maximum length for each value of any text attribute. However, if an  
2428 attribute will always contain values whose maximum length is much less than MAX, the definition of that  
2429 attribute will include a qualifier that defines the maximum length for values of that attribute. For example:  
2430 the "printer-location" attribute is specified as "printer-location (text(127))". In this case, text values for  
2431 "printer-location" MUST NOT exceed 127 octets; if supplied with a longer text string via some external  
2432 interface (other than the protocol), implementations are free to truncate to this shorter length limitation.

2433 In this [specification document](#), all text attributes are defined using the 'text' syntax. However, 'text' is used  
2434 only for brevity; the formal interpretation of 'text' is: 'textWithoutLanguage | textWithLanguage'. That is,  
2435 for any attribute defined in this [specification document](#) using the 'text' attribute syntax, all IPP objects and  
2436 clients MUST support both the 'textWithoutLanguage' and 'textWithLanguage' attribute syntaxes.  
2437 However, in actual usage and protocol execution, objects and clients accept and return only one of the two  
2438 syntax per attribute. The syntax 'text' never appears "on-the-wire".

2439 Both 'textWithoutLanguage' and 'textWithLanguage' are needed to support the real world needs of  
2440 interoperability between sites and systems that use different natural languages as the basis for human  
2441 communication. Generally, one natural language applies to all text attributes in a given request or response.  
2442 The language is indicated by the "attributes-natural-language" operation attribute defined in section 3.1.4 or  
2443 "attributes-natural-language" job attribute defined in section 4.3.20, and there is no need to identify the  
2444 natural language for each text string on a value-by-value basis. In these cases, the attribute syntax  
2445 'textWithoutLanguage' is used for text attributes. In other cases, the client needs to supply or the Printer  
2446 object needs to return a text value in a natural language that is different from the rest of the text values in  
2447 the request or response. In these cases, the client or Printer object uses the attribute syntax  
2448 'textWithLanguage' for text attributes (this is the Natural Language Override mechanism described in  
2449 section 3.1.4).

2450 The 'textWithoutLanguage' and 'textWithLanguage' attribute syntaxes are described in more detail in the  
2451 following sections.

#### 2452 4.1.1.1 'textWithoutLanguage'

2453 The 'textWithoutLanguage' syntax indicates a value that is sequence of zero or more characters. Text  
2454 strings are encoded using the rules of some charset. The Printer object MUST support the UTF-8 charset  
2455 [\[RFC2044\]](#)[\[RFC2279\]](#) and MAY support additional charsets to represent 'text' values, provided that the  
2456 charsets are registered with IANA [IANA-CS]. See Section 4.1.7 for the [specification definition](#) of the  
2457 'charset' attribute syntax, including restricted semantics and examples of charsets.

#### 2458 4.1.1.2 'textWithLanguage'

2459 The 'textWithLanguage' attribute syntax is a compound attribute syntax consisting of two parts: a  
2460 'textWithoutLanguage' part plus an additional 'naturalLanguage' (see section 4.1.8) part that overrides the  
2461 natural language in force. The 'naturalLanguage' part explicitly identifies the natural language that applies  
2462 to the text part of that value and that value alone. For any give text attribute, the 'textWithoutLanguage' part  
2463 is limited to the maximum length defined for that attribute, but the 'naturalLanguage' part is always limited  
2464 to 63 octets. Using the 'textWithLanguage' attribute syntax rather than the normal 'textWithoutLanguage'  
2465 syntax is the so-called Natural Language Override mechanism and MUST be supported by all IPP objects  
2466 and clients.

2467 If the attribute is multi-valued (1setOf text), then the 'textWithLanguage' attribute syntax MUST be used to  
2468 explicitly specify each attribute value whose natural language needs to be overridden. Other values in a  
2469 multi-valued 'text' attribute in a request or a response revert to the natural language of the operation  
2470 attribute.

2471 In a create request, the Printer object MUST accept and store with the Job object any natural language in the  
2472 "attributes-natural-language" operation attribute, whether the Printer object supports that natural language  
2473 or not. Furthermore, the Printer object MUST accept and store any 'textWithLanguage' attribute value,  
2474 whether the Printer object supports that natural language or not. These requirements are independent of the  
2475 value of the "ipp-attribute-fidelity" operation attribute that the client MAY supply.

2476 Example: If the client supplies the "attributes-natural-language" operation attribute with the value: 'en'  
2477 indicating English, but the value of the "job-name" attribute is in French, the client MUST use the  
2478 'textWithLanguage' attribute syntax with the following two values:

2479 'fr': Natural Language Override indicating French

2480 'Rapport Mensuel': the job name in French

2481

2482 See the ~~Encoding and Transport~~ "Encoding and Transport" document [IPP-PRO] for a detailed example of  
2483 the 'textWithLanguage' attribute syntax.

#### 2484 4.1.2 'name'

2485 This syntax type is used for user-friendly strings, such as a Printer name, that, for humans, are more  
2486 meaningful than identifiers. Names are never translated from one natural language to another. The 'name'  
2487 attribute syntax is essentially the same as 'text', including the REQUIRED support of UTF-8 except that the  
2488 sequence of characters is limited so that its encoded form MUST NOT exceed 255 (MAX) octets.

2489 Also like 'text', 'name' is really an abbreviated notation for either 'nameWithoutLanguage' or  
2490 'nameWithLanguage'. That is, all IPP objects and clients MUST support both the 'nameWithoutLanguage'  
2491 and 'nameWithLanguage' attribute syntaxes. However, in actual usage and protocol execution, objects and  
2492 clients accept and return only one of the two syntax per attribute. The syntax 'name' never appears "on-the-  
2493 wire".

2494 ~~Note:~~ Only the 'text' and 'name' attribute syntaxes permit the Natural Language Override mechanism.

2495 Some attributes are defined as 'type3 keyword | name'. These attributes support values that are either type3  
2496 keywords or names. This dual-syntax mechanism enables a site administrator to extend these attributes to  
2497 legally include values that are locally defined by the site administrator. Such names are not registered with  
2498 IANA.

##### 2499 4.1.2.1 'nameWithoutLanguage'

2500 The 'nameWithoutLanguage' syntax indicates a value that is sequence of zero or more characters so that its  
2501 encoded form does not exceed MAX octets.

##### 2502 4.1.2.2 'nameWithLanguage'

2503 The 'nameWithLanguage' attribute syntax is a compound attribute syntax consisting of two parts: a  
2504 'nameWithoutLanguage' part plus an additional 'naturalLanguage' (see section 4.1.8) part that overrides the

2505 natural language in force. The 'naturalLanguage' part explicitly identifies the natural language that applies  
2506 to that name value and that name value alone.

2507 The 'nameWithLanguage' attribute syntax behaves the same as the 'textWithLanguage' syntax. If a name is  
2508 in a language that is different than the rest of the object or operation, then this 'nameWithLanguage' syntax  
2509 is used rather than the generic 'nameWithoutLanguage' syntax.

2510 Example: If the client supplies the "attributes-natural-language" operation attribute with the value: 'en'  
2511 indicating English, but the "printer-name" attribute is in German, the client MUST use the  
2512 'nameWithLanguage' attribute syntax as follows:

2513 'de': Natural Language Override indicating German  
2514 'Farbdrucker': the Printer name in German  
2515

#### 2516 4.1.2.3 Matching 'name' attribute values

2517 For purposes of matching two 'name' attribute values for equality, such as in job validation (where a client-  
2518 supplied value for attribute "xxx" is checked to see if the value is among the values of the Printer object's  
2519 corresponding "xxx-supported" attribute), the following match rules apply:

2520 1. 'keyword' values never match 'name' values.

2521 2. 'name' (nameWithoutLanguage and nameWithLanguage) values match if (1) the name parts  
2522 match and (2) the Associated Natural-Language parts (see section 3.1.4.1) match. The matching  
2523 rules are:

2524 a. the name parts match if the two names are identical character by character, except it is  
2525 RECOMMENDED that case be ignored. For example: 'Ajax-letter-head-white' MUST  
2526 match 'Ajax-letter-head-white' and SHOULD match 'ajax-letter-head-white' and 'AJAX-  
2527 LETTER-HEAD-WHITE'.

2528 b. the Associated Natural-Language parts match if the shorter of the two meets the syntactic  
2529 requirements of RFC 1766 [RFC1766] and matches byte for byte with the longer. For  
2530 example, 'en' matches 'en', 'en-us' and 'en-gb', but matches neither 'fr' nor 'e'.

#### 2531 4.1.3 'keyword'

2532 The 'keyword' attribute syntax is a sequence of characters, length: 1 to 255, containing only the US-ASCII  
2533 [ASCII] encoded values for lowercase letters ("a" - "z"), digits ("0" - "9"), hyphen ("-"), dot ("."), and  
2534 underscore ("\_"). The first character MUST be a lowercase letter. Furthermore, keywords MUST be in  
2535 U.S. English.

2536 This syntax type is used for enumerating semantic identifiers of entities in the abstract protocol, i.e., entities  
2537 identified in this document. Keywords are used as attribute names or values of attributes. Unlike 'text' and  
2538 'name' attribute values, 'keyword' values MUST NOT use the Natural Language Override mechanism, since  
2539 they MUST always be US-ASCII and U.S. English.

2540 Keywords are for use in the protocol. A user interface will likely provide a mapping between protocol  
2541 keywords and displayable user-friendly words and phrases which are localized to the natural language of  
2542 the user. While the keywords specified in this document MAY be displayed to users whose natural  
2543 language is U.S. English, they MAY be mapped to other U.S. English words for U.S. English users, since  
2544 the user interface is outside the scope of this document.

2545 In the definition for each attribute of this syntax type, the full set of defined keyword values for that  
2546 attribute are listed.

2547 When a keyword is used to represent an attribute (its name), it MUST be unique within the full scope of all  
2548 IPP objects and attributes. When a keyword is used to represent a value of an attribute, it MUST be unique  
2549 just within the scope of that attribute. That is, the same keyword MUST NOT be used for two different  
2550 values within the same attribute to mean two different semantic ideas. However, the same keyword MAY  
2551 be used across two or more attributes, representing different semantic ideas for each attribute. Section 6.1  
2552 describes how the protocol can be extended with new keyword values. Examples of attribute name  
2553 keywords:

2554 "job-name"  
2555 "attributes-charset"

2556

2557 Note: This document uses "type1", "type2", and "type3" prefixes to the "keyword" basic syntax to indicate  
2558 different levels of review for extensions (see section 6.1).

#### 2559 4.1.4 'enum'

2560 The 'enum' attribute syntax is an enumerated integer value that is in the range from 1 to  $2^{*}31 - 1$  (MAX).  
2561 Each value has an associated 'keyword' name. In the definition for each attribute of this syntax type, the full  
2562 set of possible values for that attribute are listed. This syntax type is used for attributes for which there are  
2563 enum values assigned by other standards, such as SNMP MIBs. A number of attribute enum values in this  
2564 [specification document](#) are also used for corresponding attributes in other standards [RFC1759]. This  
2565 syntax type is not used for attributes to which the [system](#) administrator may assign values. Section 6.1  
2566 describes how the protocol can be extended with new enum values.

2567 Enum values are for use in the protocol. A user interface will provide a mapping between protocol enum  
2568 values and displayable user-friendly words and phrases which are localized to the natural language of the  
2569 user. While the enum symbols specified in this document MAY be displayed to users whose natural  
2570 language is U.S. English, they MAY be mapped to other U.S. English words for U.S. English users, since  
2571 the user interface is outside the scope of this document.

2572 Note: SNMP MIBs use '2' for 'unknown' which corresponds to the IPP "out-of-band" value 'unknown'. See  
2573 the description of the "out-of-band" values at the beginning of Section 4.1. Therefore, attributes of type  
2574 'enum' start at '3'.

2575 Note: This document uses "type1", "type2", and "type3" prefixes to the "enum" basic syntax to indicate  
2576 different levels of review for extensions (see section 6.1).

2577 4.1.5 'uri'

2578 The 'uri' attribute syntax is any valid Uniform Resource Identifier or URI [RFC2396]. Most often, URIs are  
2579 simply Uniform Resource Locators or URLs. The maximum length of URIs used as values of IPP  
2580 attributes is 1023 octets. Although most other IPP attribute syntax types allow for only lower-cased values,  
2581 this attribute syntax type conforms to the case-sensitive and case-insensitive rules specified in [RFC2396].  
2582 See also [IPP-IIG] for a discussion of case in URIs.

2583 4.1.6 'uriScheme'

2584 The 'uriScheme' attribute syntax is a sequence of characters representing a URI scheme according to RFC  
2585 2396 [RFC2396]. Though RFC 2396 requires that the values be case-insensitive, IPP requires all lower  
2586 case values in IPP attributes to simplify comparing by IPP clients and Printer objects.

2587 Standard values for this syntax type are the following keywords:

2588 'ipp': for IPP schemed URIs (e.g., "ipp:...")  
2589 'http': for HTTP schemed URIs (e.g., "~~http:....~~" "http:...")  
2590 'https': for use with HTTPS schemed URIs (e.g., "https:...") (not on IETF standards track)  
2591 'ftp': for FTP schemed URIs (e.g., "ftp:...")  
2592 'mailto': for SMTP schemed URIs (e.g., "mailto:...")  
2593 'file': for file schemed URIs (e.g., "file:...")  
2594

2595 A Printer object MAY support any URI 'scheme' that has been registered with IANA [IANA-MT]. The  
2596 maximum length of URI 'scheme' values used to represent IPP attribute values is 63 octets.

2597 4.1.7 'charset'

2598 The 'charset' attribute syntax is a standard identifier for a charset. A charset is a coded character set and  
2599 encoding scheme. Charsets are used for labeling certain document contents and 'text' and 'name' attribute  
2600 values. The syntax and semantics of this attribute syntax are specified in RFC 2046 [RFC2046] and  
2601 contained in the IANA character-set Registry [IANA-CS] according to the IANA procedures [RFC2278].  
2602 Though RFC 2046 requires that the values be case-insensitive US-ASCII, IPP requires all lower case values  
2603 in IPP attributes to simplify comparing by IPP clients and Printer objects. When a character-set in the  
2604 IANA registry has more than one name (alias), the name labeled as "(preferred MIME name)", if present,  
2605 MUST be used.

2606 The maximum length of 'charset' values used to represent IPP attribute values is 63 octets.

2607 Some examples are:

2608 'utf-8': ISO 10646 Universal Multiple-Octet Coded Character Set (UCS) represented as the UTF-8  
2609 [RFC2279] transfer encoding scheme in which US-ASCII is a subset charset.  
2610 'us-ascii': 7-bit American Standard Code for Information Interchange (ASCII), ANSI X3.4-1986  
2611 [ASCII]. That standard defines US-ASCII, but RFC 2045 [RFC2045] eliminates most of the control  
2612 characters from conformant usage in MIME and IPP.

2613 'iso-8859-1': 8-bit One-Byte Coded Character Set, Latin Alphabet Nr 1 [ISO8859-1]. That standard  
2614 defines a coded character set that is used by Latin languages in the Western Hemisphere and  
2615 Western Europe. US-ASCII is a subset charset.  
2616 'iso-10646-ucs-2': ISO 10646 Universal Multiple-Octet Coded Character Set (UCS) represented as two  
2617 octets (UCS-2), with the high order octet of each pair coming first (so-called Big Endian integer).  
2618

2619 Some attribute descriptions MAY place additional requirements on charset values that may be used, such as  
2620 REQUIRED values that MUST be supported or additional restrictions, such as requiring that the charset  
2621 have US-ASCII as a subset charset.

#### 2622 4.1.8 'naturalLanguage'

2623 The 'naturalLanguage' attribute syntax is a standard identifier for a natural language and optionally a  
2624 country. The values for this syntax type are defined by RFC 1766 [RFC1766]. Though RFC 1766 requires  
2625 that the values be case-insensitive US-ASCII, IPP requires all lower case to simplify comparing by IPP  
2626 clients and Printer objects. Examples include:

2627 'en': for English  
2628 'en-us': for US English  
2629 'fr': for French  
2630 'de': for German  
2631

2632 The maximum length of 'naturalLanguage' values used to represent IPP attribute values is 63 octets.

#### 2633 4.1.9 'mimeType'

2634 The 'mimeType' attribute syntax is the Internet Media Type (sometimes called MIME type) as  
2635 defined by RFC 2046 [RFC2046] and registered according to the procedures of RFC 2048 [RFC2048] for  
2636 identifying a document format. The value MAY include a charset parameter, depending on the  
2637 specification of the Media Type in the IANA Registry [IANA-MT]. Although most other IPP syntax types  
2638 allow for only lower-cased values, this syntax type allows for mixed-case values which are case-insensitive.

2639 Examples are:

2640 'text/html': An HTML document  
2641 'text/plain': A plain text document in US-ASCII (RFC 2046 indicates that in the absence of the charset  
2642 parameter MUST mean US-ASCII rather than simply unspecified) [RFC2046].  
2643 'text/plain; charset=US-ASCII': A plain text document in US-ASCII [52, 56].  
2644 'text/plain; charset=ISO-8859-1': A plain text document in ISO 8859-1 (Latin 1) [ISO8859-1].  
2645 'text/plain; charset=utf-8': A plain text document in ISO 10646 represented as UTF-8  
2646 [\[RFC2044\]](#)[\[RFC2279\]](#)  
2647 ~~'text/plain; charset=iso-10646-ucs-2': A plain text document in ISO 10646 represented in two octets~~  
2648 ~~(UCS-2) [ISO10646-1]~~  
2649 'application/postscript': A PostScript document [RFC2046]

2650 'application/vnd.hp-PCL': A PCL document [IANA-MT] (charset escape sequence embedded in the  
2651 document data)  
2652 'application/pdf': Portable Document Format - see IANA MIME Media Type registry  
2653 'application/octet-stream': Auto-sense - see below section 4.1.9.1  
2654

#### 2655 4.1.9.1 Application/octet-stream -- Auto-Sensing the document format

2656 One special type is 'application/octet-stream'. If the Printer object supports this value, the Printer object  
2657 MUST be capable of auto-sensing the format of the document data, either as part of the create operation  
2658 and/or at document processing time. During auto-sensing, a Printer may determine that the document-data  
2659 has a format data, that the Printer doesn't recognize. If the Printer determines this problem before returning  
2660 an operation response, it rejects the request and returns the 'client-error-document-format-not-supported'  
2661 status code. If the Printer determines this problem after accepting the request and returning an operation  
2662 response with one of the successful status codes, the Printer adds the 'unsupported-document-format' value  
2663 to the job's "job-state-reasons" attribute.

2664 If the Printer object's default value attribute "document-format-default" is set to 'application/octet-stream',  
2665 the Printer object not only supports auto-sensing of the document format, but will depend on the result of  
2666 applying its auto-sensing when the client does not supply the "document-format" attribute. If the client  
2667 supplies a document format value, the Printer MUST rely on the supplied attribute, rather than trust its  
2668 auto-sensing algorithm. To summarize:

- 2669 1. If the client does not supply a document format value, the Printer MUST rely on its default value  
2670 setting (which may be 'application/octet-stream' indicating an auto-sensing mechanism).
- 2671 2. If the client supplies a value other than 'application/octet-stream', the client is supplying valid  
2672 information about the format of the document data and the Printer object MUST trust the client  
2673 supplied value more than the outcome of applying an automatic format detection mechanism. For  
2674 example, the client may be requesting the printing of a PostScript file as a 'text/plain' document.  
2675 The Printer object MUST print a text representation of the PostScript commands rather than  
2676 interpret the stream of PostScript commands and print the result.
- 2677 3. If the client supplies a value of 'application/octet-stream', the client is indicating that the Printer  
2678 object MUST use its auto-sensing mechanism on the client supplied document data whether auto-  
2679 sensing is the Printer object's default or not.

2681 Note: Since the auto-sensing algorithm is probabilistic, if the client requests both auto-sensing ("document-  
2682 format" set to 'application/octet-stream') and true fidelity ("ipp-attribute-fidelity" set to 'true'), the Printer  
2683 object might not be able to guarantee exactly what the end user intended (the auto-sensing algorithm might  
2684 mistake one document format for another-), but it is able to guarantee that its auto-sensing mechanism be  
2685 used.

2686 The maximum length of a 'mimeMediaType' value to represent IPP attribute values is 255 octets.

2687 4.1.10 'octetString'

2688 The 'octetString' attribute syntax is a sequence of octets encoded in a maximum of 1023 octets which is  
2689 indicated in sub-section headers using the notation: octetString(MAX). This syntax type is used for opaque  
2690 data.

2691 4.1.11 'boolean'

2692 The 'boolean' attribute syntax has only two values: 'true' and 'false'.

2693 4.1.12 'integer'

2694 The 'integer' attribute syntax is an integer value that is in the range from  $-2^{31}$  (MIN) to  $2^{31} - 1$  (MAX).  
2695 Each individual attribute may specify the range constraint explicitly in sub-section headers if the range is  
2696 different from the full range of possible integer values. For example: job-priority (integer(1:100)) for the  
2697 "job-priority" attribute. However, the enforcement of that additional constraint is up to the IPP objects, not  
2698 the protocol.

2699 4.1.13 'rangeOfInteger'

2700 The 'rangeOfInteger' attribute syntax is an ordered pair of integers that defines an inclusive range of integer  
2701 values. The first integer specifies the lower bound and the second specifies the upper bound. If a range  
2702 constraint is specified in the header description for an attribute in this document whose attribute syntax is  
2703 'rangeOfInteger' (i.e., 'X:Y' indicating X as a minimum value and Y as a maximum value), then the  
2704 constraint applies to both integers.

2705 4.1.14 'dateTime'

2706 The 'dateTime' attribute syntax is a standard, fixed length, 11 octet representation of the "DateAndTime"  
2707 syntax as defined in RFC ~~1903 [RFC1903]~~, ~~RFC 1903~~ 2579 [RFC2579]. RFC 2579 also identifies an 8  
2708 octet representation of a "DateAndTime" value, but IPP objects MUST use the 11 octet representation. A  
2709 user interface will provide a mapping between protocol dateTime values and displayable user-friendly  
2710 words or presentation values and phrases which are localized to the natural language and date format of the  
2711 user, including time zone.

2712 4.1.15 'resolution'

2713 The 'resolution' attribute syntax specifies a two-dimensional resolution in the indicated units. It consists of  
2714 3 values: a cross feed direction resolution (positive integer value), a feed direction resolution (positive  
2715 integer value), and a units value. The semantics of these three components are taken from the Printer MIB  
2716 [RFC1759] suggested values. That is, the cross feed direction component resolution component is the same  
2717 as the prtMarkerAddressabilityXFeedDir object in the Printer MIB, the feed direction component resolution  
2718 component is the same as the prtMarkerAddressabilityFeedDir in the Printer MIB, and the units component  
2719 is the same as the prtMarkerAddressabilityUnit object in the Printer MIB (namely, '3' indicates dots per inch

2720 and '4' indicates dots per centimeter). All three values MUST be present even if the first two values are the  
2721 same. Example: '300', '600', '3' indicates a 300 dpi cross-feed direction resolution, a 600 dpi feed direction  
2722 resolution, since a '3' indicates dots per inch (dpi).

#### 2723 4.1.16 '1setOf X'

2724 The '1setOf X' attribute syntax is 1 or more values of attribute syntax type X. This syntax type is used for  
2725 multi-valued attributes. The syntax type is called '1setOf' rather than just 'setOf' as a reminder that the set  
2726 of values MUST NOT be empty (i.e., a set of size 0). Sets are normally unordered. However each attribute  
2727 description of this type may specify that the values MUST be in a certain order for that attribute.

## 2728 4.2 Job Template Attributes

2729 Job Template attributes describe job processing behavior. Support for Job Template attributes by a Printer  
2730 object is OPTIONAL (see section 12.2.3 for a description of support for OPTIONAL attributes). Also,  
2731 clients OPTIONALLY supply Job Template attributes in create requests.

2732 Job Template attributes conform to the following rules. For each Job Template attribute called "xxx":

- 2733 1. If the Printer object supports "xxx" then it MUST support both a "xxx-default" attribute (unless there  
2734 is a "No" in the table below) and a "xxx-supported" attribute. If the Printer object doesn't support  
2735 "xxx", then it MUST support neither an "xxx-default" attribute nor an "xxx-supported" attribute,  
2736 and it MUST treat an attribute "xxx" supplied by a client as unsupported. An attribute "xxx" may be  
2737 supported for some document formats and not supported for other document formats. For example,  
2738 it is expected that a Printer object would only support "orientation-requested" for some document  
2739 formats (such as 'text/plain' or 'text/html') but not others (such as 'application/postscript').
- 2740 2. "xxx" is OPTIONALLY supplied by the client in a create request. If "xxx" is supplied, the client is  
2741 indicating a desired job processing behavior for this Job. When "xxx" is not supplied, the client is  
2742 indicating that the Printer object apply its default job processing behavior at job processing time if  
2743 the document content does not contain an embedded instruction indicating an xxx-related behavior.  
2744

2745 ~~Note:~~ Since an administrator MAY change the default value attribute after a Job object has been  
2746 submitted but before it has been processed, the default value used by the Printer object at job  
2747 processing time may be different that the default value in effect at job submission time.

- 2748 3. The "xxx-supported" attribute is a Printer object attribute that describes which job processing  
2749 behaviors are supported by that Printer object. A client can query the Printer object to find out what  
2750 xxx-related behaviors are supported by inspecting the returned values of the "xxx-supported"  
2751 attribute.  
2752

2753 Note: The "xxx" in each "xxx-supported" attribute name is singular, even though an "xxx-  
2754 supported" attribute usually has more than one value, such as "job-sheet-supported", unless the  
2755 "xxx" Job Template attribute is plural, such as "finishings" or "sides". In such cases the "xxx-  
2756 supported" attribute names are: "finishings-supported" and "sides-supported".  
2757  
2758

- 2759  
2760 4. The "xxx-default" default value attribute describes what will be done at job processing time when no  
2761 other job processing information is supplied by the client (either explicitly as an IPP attribute in the  
2762 create request or implicitly as an embedded instruction within the document data).  
2763

2764 If an application wishes to present an end user with a list of supported values from which to choose, the  
2765 application SHOULD query the Printer object for its supported value attributes. The application SHOULD  
2766 also query the default value attributes. If the application then limits selectable values to only those value  
2767 that are supported, the application can guarantee that the values supplied by the client in the create request  
2768 all fall within the set of supported values at the Printer. When querying the Printer, the client MAY  
2769 enumerate each attribute by name in the Get-Printer-Attributes Request, or the client MAY just name the  
2770 "job-template" group in order to get the complete set of supported attributes (both supported and default  
2771 attributes).

2772 The "finishings" attribute is an example of a Job Template attribute. It can take on a set of values such as  
2773 'staple', 'punch', and/or 'cover'. A client can query the Printer object for the "finishings-supported" attribute  
2774 and the "finishings-default" attribute. The supported attribute contains a set of supported values. The  
2775 default value attribute contains the finishing value(s) that will be used for a new Job if the client does not  
2776 supply a "finishings" attribute in the create request and the document data does not contain any  
2777 corresponding finishing instructions. If the client does supply the "finishings" attribute in the create  
2778 request, the IPP object validates the value or values to make sure that they are a subset of the supported  
2779 values identified in the Printer object's "finishings-supported" attribute. See section 3.1.7.

2780 The table below summarizes the names and relationships for all Job Template attributes. The first column  
2781 of the table (labeled "Job Attribute") shows the name and syntax for each Job Template attribute in the Job  
2782 object. These are the attributes that can optionally be supplied by the client in a create request. The last  
2783 two columns (labeled "Printer: Default Value Attribute" and "Printer: Supported Values Attribute") shows  
2784 the name and syntax for each Job Template attribute in the Printer object (the default value attribute and the  
2785 supported values attribute). A "No" in the table means the Printer MUST NOT support the attribute (that is,  
2786 the attribute is simply not applicable). For brevity in the table, the 'text' and 'name' entries do not show the  
2787 maximum length for each attribute.

2788	+=====+	+=====+	+=====+

2849			
2850			

2851 4.2.1 job-priority (integer(1:100))

2852 This attribute specifies a priority for scheduling the Job. A higher value specifies a higher priority. The  
2853 value 1 indicates the lowest possible priority. The value 100 indicates the highest possible priority. Among  
2854 those jobs that are ready to print, a Printer MUST print all jobs with a priority value of n before printing  
2855 those with a priority value of n-1 for all n.

2856 If the Printer object supports this attribute, it MUST always support the full range from 1 to 100. No  
2857 administrative restrictions are permitted. This way an end-user can always make full use of the entire range  
2858 with any Printer object. If privileged jobs are implemented outside [IPP/1.0](#), [IPP/1.1](#), they MUST have  
2859 priorities higher than 100, rather than restricting the range available to end-users.

2860 If the client does not supply this attribute and this attribute is supported by the Printer object, the Printer  
2861 object MUST use the value of the Printer object's "job-priority-default" at job submission time (unlike most  
2862 Job Template attributes that are used if necessary at job processing time).

2863 The syntax for the "job-priority-supported" is also integer(1:100). This single integer value indicates the  
2864 number of priority levels supported. The Printer object MUST take the value supplied by the client and  
2865 map it to the closest integer in a sequence of n integers values that are evenly distributed over the range  
2866 from 1 to 100 using the formula:

2867 
$$\text{roundToNearestInt}((100x+50)/n)$$

2868 where n is the value of "job-priority-supported" and x ranges from 0 through n-1.

2869 For example, if n=1 the sequence of values is 50; if n=2, the sequence of values is: 25 and 75; if n = 3, the  
2870 sequence of values is: 17, 50 and 83; if n = 10, the sequence of values is: 5, 15, 25, 35, 45, 55, 65, 75, 85,  
2871 and 95; if n = 100, the sequence of values is: 1, 2, 3, ... 100.

2872 If the value of the Printer object's "job-priority-supported" is 10 and the client supplies values in the range 1  
2873 to 10, the Printer object maps them to 5, in the range 11 to 20, the Printer object maps them to 15, etc.

## 4.2.2 job-hold-until (type3 keyword | name (MAX))

This attribute specifies the named time period during which the Job MUST become a candidate for printing.

Standard keyword values for named time periods are:

'no-hold': immediately, if there are not other reasons to hold the job

'indefinite': - the job is held indefinitely, until a client performs a Release-Job (section 3.3.6)

'day-time': during the day

'evening': evening

'night': night

'weekend': weekend

'second-shift': second-shift (after close of business)

'third-shift': third-shift (after midnight)

An administrator MUST associate allowable print times with a named time period (by means outside ~~IPP/1.0~~; the scope of this IPP/1.1 document). An administrator is encouraged to pick names that suggest the type of time period. An administrator MAY define additional values using the 'name' or 'keyword' attribute syntax, depending on implementation.

If the value of this attribute specifies a time period that is in the future, the Printer ~~MUST~~SHOULD add the 'job-hold-until-specified' value to the job's "job-state-reasons" attribute, MUST move the job to the 'pending-held' state, and MUST NOT schedule the job for printing until the specified time-period arrives.

When the specified time period arrives, the Printer MUST remove the 'job-hold-until-specified' value from the job's "job-state-reason" ~~attribute and, if~~attribute, if present. If there are no other job state reasons that keep the job in the 'pending-held' state, the Printer MUST consider the job as a candidate for processing by moving the job to the 'pending' state.

If this job attribute value is the named value 'no-hold', or the specified time period has already started, the job MUST be a candidate for processing immediately.

If the client does not supply this attribute and this attribute is supported by the Printer object, the Printer object MUST use the value of the Printer object's "job-hold-until-default" at job submission time (unlike most Job Template attributes that are used if necessary at job processing time).

## 4.2.3 job-sheets (type3 keyword | name(MAX))

This attribute determines which job start/end sheet(s), if any, MUST be printed with a job.

Standard keyword values are:

'none': no job sheet is printed

'standard': one or more site specific standard job sheets are printed, e.g. a single start sheet or both start and end sheet is printed

2909 An administrator MAY define additional values using the 'name' or 'keyword' attribute syntax, depending  
2910 on implementation.

2911 ~~Note:~~ The effect of this attribute on jobs with multiple documents MAY be affected by the "multiple-  
2912 document-handling" job attribute (section 4.2.4), depending on the job sheet semantics.

#### 2913 4.2.4 multiple-document-handling (type2 keyword)

2914 This attribute is relevant only if a job consists of two or more documents. This attribute MUST be  
2915 supported if the Printer supports multiple documents per job (see sections 3.2.4 and 3.3.1). The attribute  
2916 controls finishing operations and the placement of one or more print-stream pages into impressions and  
2917 onto media sheets. When the value of the "copies" attribute exceeds 1, it also controls the order in which  
2918 the copies that result from processing the documents are produced. For the purposes of this explanations, if  
2919 "a" represents an instance of document data, then the result of processing the data in document "a" is a  
2920 sequence of media sheets represented by "a(\*)".

2921 Standard keyword values are:

2922 'single-document': If a Job object has multiple documents, say, the document data is called a and b, then  
2923 the result of processing all the document data (a and then b) MUST be treated as a single sequence  
2924 of media sheets for finishing operations; that is, finishing would be performed on the concatenation  
2925 of the sequences a(\*),b(\*). The Printer object MUST NOT force the data in each document instance  
2926 to be formatted onto a new print-stream page, nor to start a new impression on a new media sheet. If  
2927 more than one copy is made, the ordering of the sets of media sheets resulting from processing the  
2928 document data MUST be a(\*), b(\*), a(\*), b(\*), ..., and the Printer object MUST force each copy  
2929 (a(\*),b(\*)) to start on a new media sheet.

2930 'separate-documents-uncollated-copies': If a Job object has multiple documents, say, the document data  
2931 is called a and b, then the result of processing the data in each document instance MUST be treated  
2932 as a single sequence of media sheets for finishing operations; that is, the sets a(\*) and b(\*) would  
2933 each be finished separately. The Printer object MUST force each copy of the result of processing the  
2934 data in a single document to start on a new media sheet. If more than one copy is made, the ordering  
2935 of the sets of media sheets resulting from processing the document data MUST be a(\*), a(\*), ...,  
2936 b(\*), b(\*) ... .

2937 'separate-documents-collated-copies': If a Job object has multiple documents, say, the document data is  
2938 called a and b, then the result of processing the data in each document instance MUST be treated as  
2939 a single sequence of media sheets for finishing operations; that is, the sets a(\*) and b(\*) would each  
2940 be finished separately. The Printer object MUST force each copy of the result of processing the data  
2941 in a single document to start on a new media sheet. If more than one copy is made, the ordering of  
2942 the sets of media sheets resulting from processing the document data MUST be a(\*), b(\*), a(\*), b(\*),  
2943 ... .

2944 'single-document-new-sheet': Same as 'single-document', except that the Printer object MUST ensure  
2945 that the first impression of each document instance in the job is placed on a new media sheet. This  
2946 value allows multiple documents to be stapled together with a single staple where each document  
2947 starts on a new sheet.

2948

2949 The 'single-document' value is the same as 'separate-documents-collated-copies' with respect to ordering of  
2950 print-stream pages, but not media sheet generation, since 'single-document' will put the first page of the  
2951 next document on the back side of a sheet if an odd number of pages have been produced so far for the job,  
2952 while 'separate-documents-collated-copies' always forces the next document or document copy on to a new  
2953 sheet. In addition, if the "finishings" attribute specifies 'staple', then with 'single-document', documents a  
2954 and b are stapled together as a single document with no regard to new sheets, with 'single-document-new-  
2955 sheet', documents a and b are stapled together as a single document, but document b starts on a new sheet,  
2956 but with 'separate-documents-uncollated-copies' and 'separate-documents-collated-copies', documents a and  
2957 b are stapled separately.

2958 Note: None of these values provide means to produce uncollated sheets within a document, i.e., where  
2959 multiple copies of sheet n are produced before sheet n+1 of the same document.

2960 The relationship of this attribute and the other attributes that control document processing is described in  
2961 section 15.3.

#### 2962 4.2.5 copies (integer(1:MAX))

2963 This attribute specifies the number of copies to be printed.

2964 On many devices the supported number of collated copies will be limited by the number of physical output  
2965 bins on the device, and may be different from the number of uncollated copies which can be supported.

2966 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-  
2967 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that  
2968 control document processing is described in section 15.3.

#### 2969 4.2.6 finishings (1setOf type2 enum)

2970 This attribute identifies the finishing operations that the Printer uses for each copy of each printed  
2971 document in the Job. For Jobs with multiple documents, the "multiple-document-handling" attribute  
2972 determines what constitutes a "copy" for purposes of finishing.

2973 Standard enum values are:

2974	Value	Symbolic Name and Description
2975		
2976	'3'	'none': Perform no finishing
2977	'4'	'staple': Bind the document(s) with one or more staples. The exact number and placement of 2978 the staples is site-defined.
2979	'5'	'punch': This value indicates that holes are required in the finished document. The exact 2980 number and placement of the holes is site-defined The punch specification MAY be 2981 satisfied (in a site- and implementation-specific manner) either by drilling/punching, 2982 or by substituting pre-drilled media.

2983 '6' 'cover': This value is specified when it is desired to select a non-printed (or pre-printed)  
2984 cover for the document. This does not supplant the specification of a printed cover  
2985 (on cover stock medium) by the document itself.

2986 '7' 'bind': This value indicates that a binding is to be applied to the document; the type and  
2987 placement of the binding is site-defined."

2988

2989 '8' 'saddle-stitch': Bind the document(s) with one or more staples (wire stitches) along the  
2990 middle fold. The exact number and placement of the staples and the middle fold is  
2991 implementation and/or site-defined.

2992 '9' 'edge-stitch': Bind the document(s) with one or more staples (wire stitches) along one edge.  
2993 The exact number and placement of the staples is implementation and/or site-  
2994 defined.

2995 '10'-'19' reserved for future generic finishing enum values.

2996 The following values are more specific; they indicate a corner or an edge as if the document were a portrait  
2997 document (see below):

2998 '20' 'staple-top-left': Bind the document(s) with one or more staples in the top left corner.

2999 '21' 'staple-bottom-left': Bind the document(s) with one or more staples in the bottom left  
3000 corner.

3001 '22' 'staple-top-right': Bind the document(s) with one or more staples in the top right corner.

3002 '23' 'staple-bottom-right': Bind the document(s) with one or more staples in the bottom right  
3003 corner.

3004 '24' 'edge-stitch-left': Bind the document(s) with one or more staples (wire stitches) along the  
3005 left edge. The exact number and placement of the staples is implementation and/or  
3006 site-defined.

3007 '25' 'edge-stitch-top': Bind the document(s) with one or more staples (wire stitches) along the  
3008 top edge. The exact number and placement of the staples is implementation and/or  
3009 site-defined.

3010 '26' 'edge-stitch-right': Bind the document(s) with one or more staples (wire stitches) along the  
3011 right edge. The exact number and placement of the staples is implementation and/or  
3012 site-defined.

3013 '27' 'edge-stitch-bottom': Bind the document(s) with one or more staples (wire stitches) along  
3014 the bottom edge. The exact number and placement of the staples is implementation  
3015 and/or site-defined.

3016 '28' 'staple-dual-left': Bind the document(s) with two staples (wire stitches) along the left edge  
3017 assuming a portrait document (see above).

3018 '29' 'staple-dual-top': Bind the document(s) with two staples (wire stitches) along the top edge  
3019 assuming a portrait document (see above).

3020 '30' 'staple-dual-right': Bind the document(s) with two staples (wire stitches) along the right  
3021 edge assuming a portrait document (see above).

3022 '31' 'staple-dual-bottom': Bind the document(s) with two staples (wire stitches) along the bottom  
3023 edge assuming a portrait document (see above).

3024 The 'staple-xxx' values are specified with respect to the document as if the document were a portrait  
3025 document. If the document is actually a landscape or a reverse-landscape document, the client supplies the  
3026 appropriate transformed value. For example, to position a staple in the upper left hand corner of a

3027 landscape document when held for reading, the client supplies the 'staple-bottom-left' value (since  
3028 landscape is defined as a +90 degree rotation from portrait, i.e., anti-clockwise). On the other hand, to  
3029 position a staple in the upper left hand corner of a reverse-landscape document when held for reading, the  
3030 client supplies the 'staple-top-right' value (since reverse-landscape is defined as a -90 degree rotation from  
3031 portrait, i.e., clockwise).

3032 The angle (vertical, horizontal, angled) of each staple with respect to the document depends on the  
3033 implementation which may in turn depend on the value of the attribute.

3034 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-  
3035 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that  
3036 control document processing is described in section 15.3.

3037 If the client supplies a value of 'none' along with any other combination of values, it is the same as if only  
3038 that other combination of values had been supplied (that is the 'none' value has no effect).

#### 3039 4.2.7 page-ranges (1setOf rangeOfInteger (1:MAX))

3040 This attribute identifies the range(s) of print-stream pages that the Printer object uses for each copy of each  
3041 document which are to be printed. Nothing is printed for any pages identified that do not exist in the  
3042 document(s). Ranges MUST be in ascending order, for example: 1-3, 5-7, 15-19 and MUST NOT overlap,  
3043 so that a non-spooling Printer object can process the job in a single pass. If the ranges are not ascending or  
3044 are overlapping, the IPP object MUST reject the request and return the 'client-error-bad-request' status code.  
3045 The attribute is associated with print-stream pages not application-numbered pages (for example, the page  
3046 numbers found in the headers and or footers for certain word processing applications).

3047 For Jobs with multiple documents, the "multiple-document-handling" attribute determines what constitutes  
3048 a "copy" for purposes of the specified page range(s). When "multiple-document-handling" is 'single-  
3049 document', the Printer object MUST apply each supplied page range once to the concatenation of the print-  
3050 stream pages. For example, if there are 8 documents of 10 pages each, the page-range '41:60' prints the  
3051 pages in the 5th and 6th documents as a single document and none of the pages of the other documents are  
3052 printed. When "multiple-document-handling" is ~~'separate-document-uncollated-copies'~~ or ~~'separate-~~  
3053 ~~document-collated-copies'~~, 'separate-documents-uncollated-copies' or 'separate-documents-collated-copies',  
3054 the Printer object MUST apply each supplied page range repeatedly to each document copy. For the same  
3055 job, the page-range '1:3, 10:10' would print the first 3 pages and the 10th page of each of the 8 documents in  
3056 the Job, as 8 separate documents.

3057 In most cases, the exact pages to be printed will be generated by a device driver and this attribute would not  
3058 be required. However, when printing an archived document which has already been formatted, the end user  
3059 may elect to print just a subset of the pages contained in the document. In this case, if page-range = n:m is  
3060 specified, the first page to be printed will be page n. All subsequent pages of the document will be printed  
3061 through and including page m.

3062 "page-ranges-supported" is a boolean value indicating whether or not the printer is capable of supporting  
3063 the printing of page ranges. This capability may differ from one PDL to another. There is no "page-ranges-

3064 default" attribute. If the "page-ranges" attribute is not supplied by the client, all pages of the document will  
3065 be printed.

3066 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-  
3067 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that  
3068 control document processing is described in section 15.3.

#### 3069 4.2.8 sides (type2 keyword)

3070 This attribute specifies how print-stream pages are to be imposed upon the sides of an instance of a selected  
3071 medium, i.e., an impression.

3072 The standard keyword values are:

3073 'one-sided': imposes each consecutive print-stream page upon the same side of consecutive media  
3074 sheets.

3075 'two-sided-long-edge': imposes each consecutive pair of print-stream pages upon front and back sides of  
3076 consecutive media sheets, such that the orientation of each pair of print-stream pages on the medium  
3077 would be correct for the reader as if for binding on the long edge. This imposition is sometimes  
3078 called 'duplex' or 'head-to-head'.

3079 'two-sided-short-edge': imposes each consecutive pair of print-stream pages upon front and back sides  
3080 of consecutive media sheets, such that the orientation of each pair of print-stream pages on the  
3081 medium would be correct for the reader as if for binding on the short edge. This imposition is  
3082 sometimes called 'tumble' or 'head-to-toe'.

3083  
3084 'two-sided-long-edge', 'two-sided-short-edge', 'tumble', and 'duplex' all work the same for portrait or  
3085 landscape. However 'head-to-toe' is 'tumble' in portrait but 'duplex' in landscape. 'head-to-head' also  
3086 switches between 'duplex' and 'tumble' when using portrait and landscape modes.

3087 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-  
3088 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that  
3089 control document processing is described in section 15.3.

#### 3090 4.2.9 number-up (integer(1:MAX))

3091 This attribute specifies the number of print-stream pages to impose upon a single side of an instance of a  
3092 selected medium. For example, if the value is:

3093 Value	Description
3094 '1'	the Printer MUST place one print-stream page on a single side of an instance of the selected 3095 medium (MAY add some sort of translation, scaling, or rotation).
3096 '2'	the Printer MUST place two print-stream pages on a single side of an instance of the selected 3097 medium (MAY add some sort of translation, scaling, or rotation).
3098 '4'	the Printer MUST place four print-stream pages on a single side of an instance of the 3099 selected medium (MAY add some sort of translation, scaling, or rotation).
3100	

3101

3102 This attribute primarily controls the translation, scaling and rotation of print-stream pages.

3103 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-  
3104 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that  
3105 control document processing is described in section 15.3.

3106 4.2.10 orientation-requested (type2 enum)

3107 This attribute indicates the desired orientation for printed print-stream pages; it does not describe the  
3108 orientation of the client-supplied print-stream pages.

3109 For some document formats (such as 'application/postscript'), the desired orientation of the print-stream  
3110 pages is specified within the document data. This information is generated by a device driver prior to the  
3111 submission of the print job. Other document formats (such as 'text/plain') do not include the notion of  
3112 desired orientation within the document data. In the latter case it is possible for the Printer object to bind  
3113 the desired orientation to the document data after it has been submitted. It is expected that a Printer object  
3114 would only support "orientations-requested" for some document formats (e.g., 'text/plain' or 'text/html') but  
3115 not others (e.g., 'application/postscript'). This is no different than any other Job Template attribute since  
3116 section 4.2, item 1, points out that a Printer object may support or not support any Job Template attribute  
3117 based on the document format supplied by the client. However, a special mention is made here since it is  
3118 very likely that a Printer object will support "orientation-requested" for only a subset of the supported  
3119 document formats.

3120 Standard enum values are:

3121	Value	Symbolic Name and Description
3122		
3123	'3'	'portrait': The content will be imaged across the short edge of the medium.
3124	'4'	'landscape': The content will be imaged across the long edge of the medium. Landscape is defined to be a rotation of the print-stream page to be imaged by +90 degrees with respect to the medium (i.e. anti-clockwise) from the portrait orientation. Note: The +90 direction was chosen because simple finishing on the long edge is the same edge whether portrait or landscape
3125		
3126		
3127		
3128		
3129	'5'	'reverse-landscape': The content will be imaged across the long edge of the medium. Reverse-landscape is defined to be a rotation of the print-stream page to be imaged by -90 degrees with respect to the medium (i.e. clockwise) from the portrait orientation. Note: The 'reverse-landscape' value was added because some applications rotate landscape -90 degrees from portrait, rather than +90 degrees.
3130		
3131		
3132		
3133		
3134	'6'	'reverse-portrait': The content will be imaged across the short edge of the medium. Reverse-portrait is defined to be a rotation of the print-stream page to be imaged by 180 degrees with respect to the medium from the portrait orientation. Note: The 'reverse-portrait' value was added for use with the "finishings" attribute in cases where the opposite edge is desired for finishing a portrait document on simple finishing devices that have only one finishing position. Thus a 'text/plain' portrait document can be
3135		
3136		
3137		
3138		
3139		

3140 stapled "on the right" by a simple finishing device as is common use with some  
3141 middle eastern languages such as Hebrew.  
3142

3143 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-  
3144 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that  
3145 control document processing is described in section 15.3.

#### 3146 4.2.11 media (type3 keyword | name(MAX))

3147 This attribute identifies the medium that the Printer uses for all impressions of the Job.

3148 The values for "media" include medium-names, medium-sizes, input-trays and electronic forms so that one  
3149 attribute specifies the media. If a Printer object supports a medium name as a value of this attribute, such a  
3150 medium name implicitly selects an input-tray that contains the specified medium. If a Printer object  
3151 supports a medium size as a value of this attribute, such a medium size implicitly selects a medium name  
3152 that in turn implicitly selects an input-tray that contains the medium with the specified size. If a Printer  
3153 object supports an input-tray as the value of this attribute, such an input-tray implicitly selects the medium  
3154 that is in that input-tray at the time the job prints. This case includes manual-feed input-trays. If a Printer  
3155 object supports an electronic form as the value of this attribute, such an electronic form implicitly selects a  
3156 medium-name that in turn implicitly selects an input-tray that contains the medium specified by the  
3157 electronic form. The electronic form also implicitly selects an image that the Printer MUST merge with the  
3158 document data as its prints each page.

3159 Standard keyword values are (taken from ISO DPA and the Printer MIB) and are listed in section 14. An  
3160 administrator MAY define additional values using the 'name' or 'keyword' attribute syntax, depending on  
3161 implementation.

3162 There is also an additional Printer attribute named "media-ready" which differs from "media-supported" in  
3163 that legal values only include the subset of "media-supported" values that are physically loaded and ready  
3164 for printing with no operator intervention required. If an IPP object supports "media-supported", it NEED  
3165 NOT support "media-ready".

3166 The relationship of this attribute and the other attributes that control document processing is described in  
3167 section 15.3.

#### 3168 4.2.12 printer-resolution (resolution)

3169 This attribute identifies the resolution that Printer uses for the Job.

#### 3170 4.2.13 print-quality (type2 enum)

3171 This attribute specifies the print quality that the Printer uses for the Job.

3172 The standard enum values are:

	Value	Symbolic Name and Description
3173		
3174		
3175	'3'	'draft': lowest quality available on the printer
3176	'4'	'normal': normal or intermediate quality on the printer
3177	'5'	'high': highest quality available on the printer
3178		

### 3179 4.3 Job Description Attributes

3180 The attributes in this section form the attribute group called "job-description". The following table  
3181 summarizes these attributes. The third column indicates whether the attribute is a REQUIRED attribute  
3182 that MUST be supported by Printer objects. If it is not indicated as REQUIRED, then it is OPTIONAL.  
3183 The maximum size in octets for 'text' and 'name' attributes is indicated in parentheses.

3184	+	-----+	+	-----+
3185		Attribute		Syntax
3186	+	-----+	+	REQUIRED?
3187		job-uri		uri
3188	+	-----+	+	REQUIRED
3189		job-id		integer(1:MAX)
3190	+	-----+	+	REQUIRED
3191		job-printer-uri		uri
3192	+	-----+	+	REQUIRED
3193		job-more-info		uri
3194	+	-----+	+	REQUIRED
3195		job-name		name (MAX)
3196	+	-----+	+	REQUIRED
3197		job-originating-user-name		name (MAX)
3198	+	-----+	+	REQUIRED
3199		job-state		type1 enum
3200	+	-----+	+	REQUIRED
3201		job-state-reasons		1setOf type2 keyword
3202	+	-----+	+	<u>REQUIRED</u>
3203		job-state-message		text (MAX)
3204	+	-----+	+	
3205		number-of-documents		integer (0:MAX)
3206	+	-----+	+	
3207		output-device-assigned		name (127)
3208	+	-----+	+	
3209		time-at-creation		integer <del>(0:MAX)</del> <u>(MIN:MAX)</u>
3210		<u>REQUIRED</u>		
3211	+	-----+	+	
3212		time-at-processing		integer <del>(0:MAX)</del> <u>(MIN:MAX)</u>
3213		<u>REQUIRED</u>		
3214	+	-----+	+	
3215		time-at-completed		integer <u>(MIN:MAX)</u> <u>REQUIRED</u>
3216	+	-----+	+	
3217		<u>job-printer-up-time</u>		<u>integer (1:MAX)</u> <u>REQUIRED</u>
3218	+	-----+	+	
3219		<u>date-time-at-creation</u>		<u>dateTime</u> <u>OPTIONAL</u>
3220	+	-----+	+	
3221		<u>date-time-at-processing</u>		<u>dateTime</u> <u>OPTIONAL</u>

3245	+-----+-----+-----+
3246	
3247	

## 3248 4.3.1 job-uri (uri)

3249 This REQUIRED attribute contains the URI for the job. The Printer object, on receipt of a new job,  
 3250 generates a URI which identifies the new Job. The Printer object returns the value of the "job-uri" attribute  
 3251 as part of the response to a create request. The precise format of a Job URI is implementation dependent.  
 3252 If the Printer object supports more than one URI and there is some relationship between the newly formed  
 3253 Job URI and the Printer object's URI, the Printer object uses the Printer URI supplied by the client in the  
 3254 create request. For example, if the create request comes in over a secure channel, the new Job URI MUST  
 3255 use the same secure channel. This can be guaranteed because the Printer object is responsible for  
 3256 generating the Job URI and the Printer object is aware of its security configuration and policy as well as the  
 3257 Printer URI used in the create request.

3258 For a description of this attribute and its relationship to "job-id" and "job-printer-uri" attribute, see the  
 3259 discussion in section 2.4 on "Object Identity".

## 3260 4.3.2 job-id (integer(1:MAX))

3261 This REQUIRED attribute contains the ID of the job. The Printer, on receipt of a new job, generates an ID  
 3262 which identifies the new Job on that Printer. The Printer returns the value of the "job-id" attribute as part of  
 3263 the response to a create request. The 0 value is not included to allow for compatibility with SNMP index  
 3264 values which also cannot be 0.

3265 For a description of this attribute and its relationship to "job-uri" and "job-printer-uri" attribute, see the  
 3266 discussion in section 2.4 on "Object Identity".

## 3267 4.3.3 job-printer-uri (uri)

3268 This REQUIRED attribute identifies the Printer object that created this Job object. When a Printer object  
 3269 creates a Job object, it populates this attribute with the Printer object URI that was used in the create  
 3270 request. This attribute permits a client to identify the Printer object that created this Job object when only

3271 the Job object's URI is available to the client. The client queries the creating Printer object to determine  
3272 which languages, charsets, operations, are supported for this Job.

3273 For a description of this attribute and its relationship to "job-uri" and "job-id" attribute, see the discussion in  
3274 section 2.4 on "Object Identity".

#### 3275 4.3.4 job-more-info (uri)

3276 Similar to "printer-more-info", this attribute contains the URI referencing some resource with more  
3277 information about this Job object, perhaps an HTML page containing information about the Job.

#### 3278 4.3.5 job-name (name(MAX))

3279 This REQUIRED attribute is the name of the job. It is a name that is more user friendly than the "job-uri"  
3280 attribute value. It does not need to be unique between Jobs. The Job's "job-name" attribute is set to the  
3281 value supplied by the client in the "job-name" operation attribute in the create request (see Section 3.2.1.1).  
3282 If, however, the "job-name" operation attribute is not supplied by the client in the create request, the Printer  
3283 object, on creation of the Job, MUST generate a name. The printer SHOULD generate the value of the  
3284 Job's "job-name" attribute from the first of the following sources that produces a value: 1) the "document-  
3285 name" operation attribute of the first (or only) document, 2) the "document-URI" attribute of the first (or  
3286 only) document, or 3) any other piece of Job specific and/or Document Content information.

#### 3287 4.3.6 job-originating-user-name (name(MAX))

3288 This REQUIRED attribute contains the name of the end user that submitted the print job. The Printer  
3289 object sets this attribute to the most authenticated printable name that it can obtain from the authentication  
3290 service over which the IPP operation was received. Only if such is not available, does the Printer object use  
3291 the value supplied by the client in the "requesting-user-name" operation attribute of the create operation  
3292 (see Section 8).

3293 Note: The Printer object needs to keep an internal originating user id of some form, typically as a credential  
3294 of a principal, with the Job object. Since such an internal attribute is implementation-dependent and not of  
3295 interest to clients, it is not specified as a Job Description attribute. This originating user id is used for  
3296 authorization checks (if any) on all subsequent operation.

#### 3297 4.3.7 job-state (type1 enum)

3298 This REQUIRED attribute identifies the current state of the job. Even though the IPP protocol defines  
3299 ~~eight~~seven values for job states (plus the out-of-band 'unknown' value - see Section 4.1), implementations  
3300 only need to support those states which are appropriate for the particular implementation. In other words, a  
3301 Printer supports only those job states implemented by the output device and available to the Printer object  
3302 implementation.

3303 Standard enum values are:

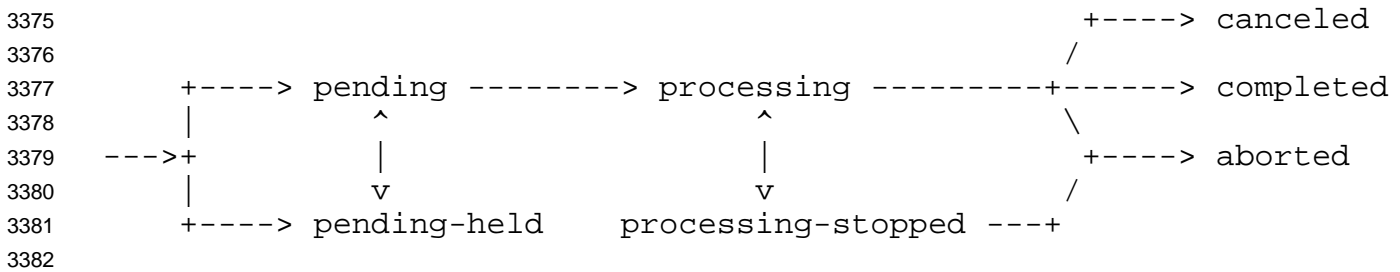

3304	Values	Symbolic Name and Description
3305		
3306	'3'	'pending': The job is a candidate to start processing, but is not yet processing.
3307		
3308	'4'	'pending-held': The job is not a candidate for processing for any number of reasons but will return to the 'pending' state as soon as the reasons are no longer present. The job's "job-state-reason" attribute MUST indicate why the job is no longer a candidate for processing.
3309		
3310		
3311		
3312		
3313	'5'	'processing': One or more of:
3314		
3315		1. the job is using, or is attempting to use, one or more purely software processes that are analyzing, creating, or interpreting a PDL, etc.,
3316		2. the job is using, or is attempting to use, one or more hardware devices that are interpreting a PDL, making marks on a medium, and/or performing finishing, such as stapling, etc.,
3317		3. the Printer object has made the job ready for printing, but the output device is not yet printing it, either because the job hasn't reached the output device or because the job is queued in the output device or some other spooler, awaiting the output device to print it.
3318		
3319		
3320		
3321		
3322		
3323		
3324		
3325		When the job is in the 'processing' state, the entire job state includes the detailed status represented in the <del>printer's</del> <b>Printer object's</b> "printer-state", "printer-state-reasons", and "printer-state-message" attributes.
3326		
3327		
3328		Implementations MAY, though they NEED NOT, include additional values in the job's "job-state-reasons" attribute to indicate the progress of the job, such as adding the 'job-printing' value to indicate when the output device is actually making marks on paper and/or the 'processing-to-stop-point' value to indicate that the IPP object is in the process of canceling or aborting the job. Most implementations won't bother with this nuance.
3329		
3330		
3331		
3332		
3333		
3334		
3335	'6'	'processing-stopped': The job has stopped while processing for any number of reasons and will return to the 'processing' state as soon as the reasons are no longer present.
3336		
3337		
3338		The job's "job-state-reason" attribute MAY indicate why the job has stopped processing. For example, if the output device is stopped, the 'printer-stopped' value MAY be included in the job's "job-state-reasons" attribute.
3339		
3340		
3341		
3342		Note: When an output device is stopped, the device usually indicates its condition in human readable form locally at the device. A client can obtain more complete device status remotely by querying the Printer object's "printer-state", "printer-state-reasons" and "printer-state-message" attributes.
3343		
3344		
3345		

3346  
3347  
3348  
3349  
3350  
3351  
3352  
3353  
3354  
3355  
3356  
3357  
3358  
3359  
3360  
3361  
3362  
3363  
3364  
3365  
3366  
3367  
3368  
3369  
3370

- '7' 'canceled': The job has been canceled by a Cancel-Job operation and the Printer object has completed canceling the job and all job status attributes have reached their final values for the job. While the Printer object is canceling the job, the job remains in its current state, but the job's "job-state-reasons" attribute SHOULD contain the 'processing-to-stop-point' value and one of the 'canceled-by-user', 'canceled-by-operator', or 'canceled-at-device' value. When the job moves to the 'canceled' state, the 'processing-to-stop-point' value, if present, MUST be removed, but the 'canceled-by-xxx', if present, MUST remain.
- '8' 'aborted': The job has been aborted by the system, usually while the job was in the 'processing' or 'processing-stopped' state and the Printer has completed aborting the job and all job status attributes have reached their final values for the job. While the Printer object is aborting the job, the job remains in its current state, but the job's "job-state-reasons" attribute SHOULD contain the 'processing-to-stop-point' and 'aborted-by-system' values. When the job moves to the 'aborted' state, the 'processing-to-stop-point' value, if present, MUST be removed, but the 'aborted-by-system' value, if present, MUST remain.
- '9' 'completed': The job has completed successfully or with warnings or errors after processing and all of the job media sheets have been successfully stacked in the appropriate output bin(s) and all job status attributes have reached their final values for the job. The job's "job-state-reasons" attribute SHOULD contain one of: 'completed-successfully', 'completed-with-warnings', or 'completed-with-errors' values.

3371 The final value for this attribute MUST be one of: 'completed', 'canceled', or 'aborted' before the Printer  
3372 removes the job altogether. The length of time that jobs remain in the 'canceled', 'aborted', and 'completed'  
3373 states depends on implementation. See section 4.3.7.2.

3374 The following figure shows the normal job state transitions.

3383 Normally a job progresses from left to right. Other state transitions are unlikely, but are not forbidden. Not  
3384 shown are the transitions to the 'canceled' state from the 'pending', 'pending-held', and 'processing-stopped'  
3385 states.

3386 Jobs reach one of the three terminal states: 'completed', 'canceled', or 'aborted', after the jobs have  
3387 completed all activity, including stacking output media, after the jobs have completed all activity, and all  
3388 job status attributes have reached their final values for the job.

#### 3389 4.3.7.1 Forwarding Servers

3390 ~~Note:~~ As with all other IPP attributes, if the implementation can-not determine the correct value for this  
3391 attribute, it SHOULD respond with the out-of-band value 'unknown' (see section 4.1) rather than try to  
3392 guess at some possibly incorrect value and give the end user the wrong impression about the state of the Job  
3393 object. For example, if the implementation is just a gateway into some printing system ~~that does not~~  
3394 ~~provide~~ from which it can normally get status, but temporarily is unable, then the implementation should  
3395 return the 'unknown' value. However, if the implementation is a gateway to a printing system that never  
3396 provides detailed status about the print job, the implementation MAY set the IPP Job object's state might  
3397 literally be 'unknown'.to 'completed', provided that it also sets the 'queued-in-device' value in the job's "job-  
3398 state-reasons" attribute (see section 4.3.8).

#### 3399 4.3.7.2 Partitioning of Job States

3400 This section partitions the 7 job states into phases: Job Not Completed, Job Retention, Job History, and Job  
3401 Removal. This section also explains the 'job-restartable' value of the "job-state-reasons" Job Description  
3402 attribute for use with the Restart-Job operation.

3403 Job Not Completed: When a job is in the 'pending', 'pending-held', 'processing', or 'processing-stopped'  
3404 states, the job is not completed.

3405 Job Retention: When a job enters one of the three terminal job states: 'completed', 'canceled', or 'aborted',  
3406 the IPP Printer object MAY "retain" the job in a restartable condition for an implementation-defined time  
3407 period. This time period MAY be zero seconds and MAY depend on the terminal job state. This phase is  
3408 called Job Retention. While in the Job Retention phase, the job's document data is retained and a client  
3409 may restart the job using the Restart-Job operation. If the IPP object supports the Restart-Job operation,  
3410 then it SHOULD indicate that the job is restartable by adding the 'job-restartable' value to the job's "job-  
3411 state-reasons" attribute (see Section 4.3.8) during the Job Retention phase.

3412 Job History: After the Job Retention phase expires for a job, the Printer object deletes the document data  
3413 for the job and the job becomes part of the Job History. The Printer object MAY also delete any number of  
3414 the job attributes. Since the job is no longer restartable, the Printer object MUST remove the 'job-  
3415 restartable' value from the job's "job-state-reasons" attribute, if present.

3416 Job Removal: After the job has remained in the Job History for an implementation-defined time, such as  
3417 when the number of jobs exceeds a fixed number or after a fixed time period (which MAY be zero  
3418 seconds), the IPP Printer removes the job from the system.

3419 Using the Get-Jobs operation and supplying the 'not-completed' value for the "which-jobs" operation  
3420 attribute, a client is requesting jobs in the Job Not Completed phase. Using the Get-Jobs operation and  
3421 supplying the 'completed' value for the "which-jobs" operation attribute, a client is requesting jobs in the  
3422 Job Retention and Job History phases. Using the Get-Job-Attributes operation, a client is requesting a job

3423 in any phase except Job Removal. After Job Removal, the Get-Job-Attributes and Get-Jobs operations no  
3424 longer are capable of returning any information about a job.

#### 3425 4.3.8 job-state-reasons (1setOf type2 keyword)

3426 This **REQUIRED** attribute provides additional information about the job's current state, i.e., information  
3427 that augments the value of the job's "job-state" attribute.

3428 ~~Implementation of these values is OPTIONAL, i.e., a Printer NEED NOT implement them, even if (1) the~~  
3429 ~~output device supports the functionality represented by the reason and (2) is available to the Printer object~~  
3430 ~~implementation.~~ These values MAY be used with any job state or states for which the reason makes sense.  
3431 Some of these value definitions indicate conformance requirements; the rest are OPTIONAL. Furthermore,  
3432 when implemented, the Printer MUST return these values when the reason applies and MUST NOT return  
3433 them when the reason no longer applies whether the value of the Job's "job-state" attribute changed or not.  
3434 When the Job does not have any reasons for being in its current state, the value of the Job's "~~job-state-~~job-  
3435 state-reasons" attribute MUST be 'none'.

3436 Note: While values cannot be added to the 'job-state' attribute without impacting deployed clients that take  
3437 actions upon receiving "job-state" values, it is the intent that additional "job-state-reasons" values can be  
3438 defined and registered without impacting such deployed clients. In other words, the "job-state-reasons"  
3439 attribute is intended to be extensible.

3440 The following standard keyword values are defined. For ease of understanding, the values are presented in  
3441 the order in which the reasons are likely to occur (if implemented), starting with the 'job-incoming' value:

3442 'none': There are no reasons for the job's current state. This state reason is semantically equivalent to  
3443 "job-state-reasons" without any value and MUST be used when there is no other value, since the  
3444 1setOf attribute syntax requires at least one value.

3445 'job-incoming': The Create-Job operation has been accepted by the Printer, but the Printer is expecting  
3446 additional Send-Document and/or Send-URI operations and/or is accessing/accepting document  
3447 data.

3448 'job-data-insufficient': The Create-Job operation has been accepted by the Printer, but the Printer is  
3449 expecting additional document data before it can move the job into the 'processing' state. If a Printer  
3450 starts processing before it has received all data, the Printer removes the 'job-data-insufficient'  
3451 reason, but the 'job-incoming' remains. If a Printer starts processing after it has received all data, the  
3452 Printer removes the 'job-data-insufficient' reason and the 'job-incoming' at the same time.

3453 'document-access-error': After accepting a Print-URI or Send-URI request, the Printer could not access  
3454 one or more documents passed by reference. This reason is intended to cover any file access  
3455 problem, including file does not exist and access denied because of an access control problem. The  
3456 Printer MAY also indicate the document access error using the "job-document-access-errors" Job  
3457 Description attribute (see section 4.3.11). Whether the Printer aborts the job and moves the job to  
3458 the 'aborted' job state or prints all documents that are accessible and moves the job to the 'completed'  
3459 job state and adds the 'completed-with-errors' value in the job's "job-state-reasons" attribute depends  
3460 on implementation and/or site policy. This value SHOULD be supported if the Print-URI or Send-  
3461 URI operations are supported.

3462 'submission-interrupted': The job was not completely submitted for some unforeseen reason, such as:  
3463 (1) the Printer has crashed before the job was closed by the client, (2) the Printer or the document  
3464 transfer method has crashed in some non-recoverable way before the document data was entirely  
3465 transferred to the Printer, (3) the client crashed or failed to close the job before the time-out period.  
3466 See section 4.4.31.

3467 'job-outgoing': The Printer is transmitting the job to the output device.

3468 'job-hold-until-specified': The value of the job's "job-hold-until" attribute was specified with a time  
3469 period that is still in the future. The job MUST NOT be a candidate for processing until this reason  
3470 is removed and there are no other reasons to hold the ~~job~~.

3471 job. This value SHOULD be supported if the "job-hold-until" Job Template attribute is supported.

3472 'resources-are-not-ready': At least one of the resources needed by the job, such as media, fonts, resource  
3473 objects, etc., is not ready on any of the physical printer's for which the job is a candidate. This  
3474 condition MAY be detected when the job is accepted, or subsequently while the job is pending or  
3475 processing, depending on implementation. The job may remain in its current state or be moved to  
3476 the 'pending-held' state, depending on implementation and/or job scheduling policy.

3477 'printer-stopped-partly': The value of the Printer's "printer-state-reasons" attribute contains the value  
3478 'stopped-partly'.

3479 'printer-stopped': The value of the Printer's "printer-state" attribute is 'stopped'.

3480 'job-interpreting': Job is in the 'processing' state, but more specifically, the Printer is interpreting the  
3481 document data.

3482 'job-queued': Job is in the 'processing' state, but more specifically, the Printer has queued the document  
3483 data.

3484 'job-transforming': Job is in the 'processing' state, but more specifically, the Printer is interpreting  
3485 document data and producing another electronic representation.

3486 'job-queued-for-marker': Job is in any of the 'pending-held', 'pending', or 'processing' states, but more  
3487 specifically, the Printer has completed enough processing of the document to be able to start  
3488 marking and the job is waiting for the marker. Systems that require human intervention to release  
3489 jobs using the Release-Job operation, put the job into the 'pending-held' job state. Systems that  
3490 automatically select a job to use the marker put the job into the 'pending' job state or keep the job in  
3491 the 'processing' job state while waiting for the marker, depending on implementation. All  
3492 implementations put the job into (or back into) the 'processing' state when marking does begin.

3493 'job-printing': The output device is marking media. This value is useful for Printers which spend a great  
3494 deal of time processing (1) when no marking is happening and then want to show that marking is  
3495 now happening or (2) when the job is in the process of being canceled or aborted while the job  
3496 remains in the 'processing' state, but the marking has not yet stopped so that impression or sheet  
3497 counts are still increasing for the job.

3498 'job-canceled-by-user': The job was canceled by the owner of the job using the Cancel-Job request, i.e.,  
3499 by a user whose authenticated identity is the same as the value of the originating user that created  
3500 the Job object, or by some other authorized end-user, such as a member of the job owner's security  
3501 ~~group~~.

3502 group. This value SHOULD be supported.

3503 'job-canceled-by-operator': The job was canceled by the operator using the Cancel-Job request, i.e., by a  
3504 user who has been authenticated as having operator privileges (whether local or remote). If the  
3505 security policy is to allow anyone to cancel anyone's job, then this value may be used when the job  
3506 is canceled by other than the owner of the job. For such a security policy, in effect, everyone is an

operator as far as canceling jobs with IPP is concerned. This value SHOULD be supported if the implementation permits canceling by other than the owner of the job.

'job-canceled-at-device': The job was canceled by an unidentified local user, i.e., a user at a console at the device. This value SHOULD be supported if the implementation supports canceling jobs at the console.

'aborted-by-system': The job (1) is in the process of being aborted, (2) has been aborted by the system and placed in the 'aborted' state, or (3) has been aborted by the system and placed in the 'pending-held' state, so that a user or operator can manually try the job again. This value SHOULD be supported.

'unsupported-compression': The job was aborted by the system because the Printer determined while attempting to decompress the document-data's that the compression is actually not among those supported by the Printer. This value MUST be supported, since "compressions is a REQUIRED operation attribute.

'compression-error': The job was aborted by the system because the Printer encountered an error in the document-data while decompressing it. If the Printer posts this reason, the document-data has already passed any tests that would have led to the 'unsupported-compression' job-state-reason.

'unsupported-document-format': The job was aborted by the system because the document-data's document-format is not among those supported by the Printer. If the client specifies the document-format as 'application/octet-stream', the printer MAY abort the job and post this reason even though the format is a member of the "document-format-supported" printer attribute, but not among the auto-sensed document-formats. This value MUST be supported, since "document-format" is a REQUIRED operation attribute.

'document-format-error': The job was aborted by the system because the Printer encountered an error in the document-data while processing it. If the Printer posts this reason, the document-data has already passed any tests that would have led to the 'unsupported-document-format' job-state-reason.

'processing-to-stop-point': The requester has issued a ~~Cancel-job~~ Cancel-Job operation or the Printer object has aborted the job, but is still performing some actions on the job until a specified stop point occurs or job termination/cleanup is completed.

~~This reason is recommended to be used in conjunction with~~ If the implementation requires some measurable time to cancel the job in the 'processing' job-state or 'processing-stopped' job states, the IPP object MUST use this value to indicate that the Printer object is still performing some actions on the job while the job remains in the 'processing' or 'processing-stopped' state. After all the job's job description attributes have stopped incrementing, the Printer object moves the job from the 'processing' state to the 'canceled' or 'aborted' job states.

'service-off-line': The Printer is off-line and accepting no jobs. All 'pending' jobs are put into the 'pending-held' state. This situation could be true if the service's or document transform's input is impaired or broken.

'job-completed-successfully': The job completed successfully. This value SHOULD be supported.

'job-completed-with-warnings': The job completed with warnings. This value SHOULD be supported if the implementation detects warnings.

'job-completed-with-errors': The job completed with errors (and possibly warnings too). This value SHOULD be supported if the implementation detects errors.

'job-restartable' - This job is retained (see section 4.3.7.2) and is currently able to be restarted using the Restart-Job operation (see section 3.3.7). If 'job-restartable' is a value of the job's 'job-state-reasons' attribute, then the IPP object MUST accept a Restart-Job operation for that job. This value SHOULD be supported if the Restart-Job operation is supported.

'queued-in-device': The job has been forwarded to a device or print system that is unable to send back status. The Printer sets the job's "job-state" attribute to 'completed' and adds the 'queued-in-device' value to the job's "job-state-reasons" attribute to indicate that the Printer has no additional information about the job and never will have any better information. See section 4.3.7.1.

#### 4.3.9 job-state-message (text(MAX))

This attribute specifies information about the "job-state" and "job-state-reasons" attributes in human readable text. If the Printer object supports this attribute, the Printer object MUST be able to generate this message in any of the natural languages identified by the Printer's "generated-natural-language-supported" attribute (see the "attributes-natural-language" operation attribute specified in Section 3.1.4.1).

~~Note: the~~The value SHOULD NOT contain additional information not contained in the values of the "job-state" and "job-states-reasons" attributes, such as interpreter error information. Otherwise, application programs might attempt to parse the (localized text). For such additional information such as interpreter errors for application program ~~consumption, a new attribute~~consumption or specific document access errors, new attributes with keyword values, needs to be developed and registered.

#### 4.3.10 job-detailed-status-messages (1setOf text(MAX))

This attribute specifies additional detailed and technical information about the job. Neither the Printer nor the client localizes the message(s), since they are intended for use by the system administrator or other experienced technical persons. Clients MUST NOT attempt to parse the value of this attribute. See "job-document-access-errors" (section 4.3.11) for additional errors that a program can process.

#### 4.3.11 job-document-access-errors (1setOf text(MAX))

This attribute provides additional information about each document access error for this job encountered by the Printer after it returned a response to the Print-URI or Send-URI operation and subsequently attempted to access document(s) supplied in the Print-URI or Send-URI operation. For errors in the protocol that is identified by the URI scheme in the "document-uri" operation attribute, such as 'http:' or 'ftp:', the error code is returned in parentheses, followed by the URI. For example:

(404) http://ftp.pwg.org/pub/pwg/ipp/new\_MOD/ipp-model-v11-990510.pdf

Most Internet protocols use decimal error codes (unlike IPP), so the ASCII error code representation is in decimal.

## 3584 4.3.12 number-of-documents (integer(0:MAX))

3585 This attribute indicates the number of documents in the job, i.e., the number of Send-Document, Send-URI,  
3586 Print-Job, or Print-URI operations that the Printer has accepted for this job, regardless of whether the  
3587 document data has reached the Printer object or not.

3588 Implementations supporting the OPTIONAL Create-Job/Send-Document/Send-URI operations SHOULD  
3589 support this attribute so that clients can query the number of documents in each job.

## 3590 4.3.13 output-device-assigned (name(127))

3591 This attribute identifies the output device to which the Printer object has assigned this job. If an output  
3592 device implements an embedded Printer object, the Printer object NEED NOT set this attribute. If a print  
3593 server implements a Printer object, the value MAY be empty (zero-length string) or not returned until the  
3594 Printer object assigns an output device to the job. This attribute is particularly useful when a single Printer  
3595 object support multiple devices (so called "fan-out").

3596 4.3.14 Event Time Job Description Attributes

3597 This section defines the Job Description attributes that indicate the time at which certain events occur for a  
3598 job. If the job event has not yet occurred, then the IPP object MUST return the 'no-value' out-of-band value  
3599 (see the beginning of Section 4.1). The "time-at-xxx(integer)" attributes represent time as an 'integer'  
3600 representing the number of seconds since the device was powered up (informally called "time ticks"). The  
3601 "date-time-at-xxx(dateTime)" attributes represent time as 'dateTime' representing date and time (including  
3602 an offset from UTC).

3603 In order to populate these attributes, the Printer object copies the value(s) of the following Printer  
3604 Description attributes at the time the event occurs:

- 3605 1. the value in the Printer's "printer-up-time" attribute for the "time-at-xxx(integer)" attributes
- 3606 2. the value in the Printer's "printer-current-time" attribute for the "date-time-at-xxx(dateTime)"  
3607 attributes.

3608 If the Printer resets its "printer-up-time" attribute to 1 on power-up (see section 4.4.29) and has persistent  
3609 jobs, then it MUST change all of jobs' "time-at-xxx(integer)" (time tick) job attributes whose events have  
3610 occurred either to:

- 3611 1. 0 to indicate that the event happened before the most recent power up OR
- 3612 2. the negative of the number of seconds before the most recent power-up that the event took place,  
3613 though the negative number NEED NOT reflect the exact number of seconds.

3614 If a client queries a "time-at-xxx(integer)" time tick Job attribute and finds the value to be 0 or negative, the  
3615 client MUST assume that the event occurred in some life other than the Printer's current life.

Note: A Printer does not change the values of any "date-time-at-xxx(dateTime)" job attributes on power-up.

4.3.14.3.14.1 time-at-creation (integer(0:MAX))(integer(MIN:MAX))

This **REQUIRED** attribute indicates the point in time at which the Job object was created. ~~In order to populate this attribute, the Printer object uses the value in its "printer-up-time" attribute at the time the Job object is created.~~

~~4.3.13~~4.3.14.3.14.2 time-at-processing (integer(0:MAX))(integer(MIN:MAX))

This **REQUIRED** attribute indicates the point in time at which the Job object ~~began processing.~~ In order to populate this attribute, the Printer object uses the value in its "printer-up-time" attribute at the time the Job object is moved into first began processing after the create operation or the most recent Restart-Job operation. The out-of-band 'no-value' value is returned if the job has not yet been in the 'processing' state for the first time. (see the beginning of Section 4.1).

~~4.3.14~~4.3.14.3.14.3 time-at-completed (integer(0:MAX))(integer(MIN:MAX))

This **REQUIRED** attribute indicates the point in time at which the Job object completed (or was cancelled or aborted). The out-of-band 'no-value' value is returned if the job has not yet completed, been canceled, or aborted (see the beginning of Section 4.1).

4.3.14.4 job-printer-up-time (integer(1:MAX))

~~In order to populate this attribute, the Printer object uses the value in its~~ This **REQUIRED** Job Description attribute indicates the amount of time (in seconds) that the Printer implementation has been up and running. This attribute is an alias for the "printer-up-time" Printer Description attribute (see Section 4.4.29).

A client MAY request this attribute in a Get-Job-Attributes or Get-Jobs request and use the value returned in combination with other requested Event Time Job Description Attributes in order to display time attributes to a user. The difference between this attribute and the 'integer' value of a "time-at-xxx" attribute is the number of seconds ago that the "time-at-xxx" event occurred. A client can compute the wall-clock time at which the "time-at-xxx" event occurred by subtracting this difference from the client's wall-clock time.

4.3.14.5 date-time-at-creation (dateTime)

This attribute indicates the date and time at which the Job object was created.

4.3.14.6 date-time-at-processing (dateTime)

This attribute indicates the date and time at which the Job object first began processing after the create operation or the most recent Restart-Job operation.

#### 4.3.14.7 date-time-at-completed (dateTime)

~~attribute at the time the Job object is moved into the 'completed' or 'canceled' or 'aborted' state. This attribute indicates the date and time at which the Job object completed (or was cancelled or aborted).~~

#### 4.3.15 number-of-intervening-jobs (integer(0:MAX))

This attribute indicates the number of jobs that are "ahead" of this job in the relative chronological order of expected time to complete (i.e., the current scheduled order). For efficiency, it is only necessary to calculate this value when an operation is performed that requests this attribute.

#### 4.3.16 job-message-from-operator (text(127))

This attribute provides a message from an operator, system administrator or "intelligent" process to indicate to the end user the reasons for modification or other management action taken on a job.

#### 4.3.17 Job Size Attributes

~~This sub-section defines job attributes that describe the size of the job. These attributes are not intended to be counters; they are intended to be useful routing and scheduling information if known. For these attributes, the Printer object may try to compute the value if it is not supplied in the create request. Even if the client does supply a value for these three attributes in the create request, the Printer object MAY choose to change the value if the Printer object is able to compute a value which is more accurate than the client supplied value. The Printer object may be able to determine the correct value for these attributes either right at job submission time or at any later point in time.~~

#### 4.3.17.1 job-k-octets (integer(0:MAX))

This attribute specifies the total size of the document(s) in K octets, i.e., in units of 1024 octets requested to be processed in the job. The value MUST be rounded up, so that a job between 1 and 1024 octets MUST be indicated as being 1, 1025 to 2048 MUST be 2, etc.

This value MUST NOT include the multiplicative factors contributed by the number of copies specified by the "copies" attribute, independent of whether the device can process multiple copies without making multiple passes over the job or document data and independent of whether the output is collated or not. Thus the value is independent of the implementation and indicates the size of the document(s) measured in K octets independent of the number of copies.

This value MUST also not include the multiplicative factor due to a copies instruction embedded in the document data. If the document data actually includes replications of the document data, this value will include such replication. In other words, this value is always the size of the source document data, rather than a measure of the hardcopy output to be produced.

~~Note: This attribute and the following two attributes ("job-impressions" and "job-media-sheets") are not intended to be counters; they are intended to be useful routing and scheduling information if known. For~~

~~these three attributes, the Printer object may try to compute the value if it is not supplied in the create request. Even if the client does supply a value for these three attributes in the create request, the Printer object MAY choose to change the value if the Printer object is able to compute a value which is more accurate than the client supplied value. The Printer object may be able to determine the correct value for these three attributes either right at job submission time or at any later point in time.~~

#### 4.3.17.2 job-impressions (integer(0:MAX))

This attribute specifies the total size in number of impressions of the document(s) being submitted (see the definition of impression in section 12.2.5).

As with "job-k-octets", this value MUST NOT include the multiplicative factors contributed by the number of copies specified by the "copies" attribute, independent of whether the device can process multiple copies without making multiple passes over the job or document data and independent of whether the output is collated or not. Thus the value is independent of the implementation and reflects the size of the document(s) measured in impressions independent of the number of copies.

As with "job-k-octets", this value MUST also not include the multiplicative factor due to a copies instruction embedded in the document data. If the document data actually includes replications of the document data, this value will include such replication. In other words, this value is always the number of impressions in the source document data, rather than a measure of the number of impressions to be produced by the job.

~~See the Note in the "job-k-octets" attribute that also applies to this attribute.~~

#### 4.3.17.3 job-media-sheets (integer(0:MAX))

This attribute specifies the total number of media sheets to be produced for this job.

Unlike the "job-k-octets" and the "job-impressions" attributes, this value MUST include the multiplicative factors contributed by the number of copies specified by the "copies" attribute and a 'number of copies' instruction embedded in the document data, if any. This difference allows the system administrator to control the lower and upper bounds of both (1) the size of the document(s) with "job-k-octets-supported" and "job-impressions-supported" and (2) the size of the job with "job-media-sheets-supported".

#### 4.3.18 See the Note in the "job-k-octets" attribute that also applies to this attribute. Job Progress Attributes

This sub-section defines job attributes that describe the progress of the job. These attributes are intended to be counters. That is, the value for a job that has not started processing MUST be 0. When the job's "job-state" is 'processing' or 'processing-stopped', this value is intended to contain the amount of the job that has been processed to the time at which the attributes are requested. When the job enters the 'completed', 'canceled', or 'aborted' states, these values are the final values for the job.

## 3711 4.3.18.1 job-k-octets-processed (integer(0:MAX))

3712 This attribute specifies the total number of octets processed in K octets, i.e., in units of 1024 octets so far.  
3713 The value MUST be rounded up, so that a job between 1 and 1024 octets inclusive MUST be indicated as  
3714 being 1, 1025 to 2048 inclusive MUST be 2, etc.

3715 For implementations where multiple copies are produced by the interpreter with only a single pass over the  
3716 data, the final value MUST be equal to the value of the "job-k-octets" attribute. For implementations where  
3717 multiple copies are produced by the interpreter by processing the data for each copy, the final value MUST  
3718 be a multiple of the value of the "job-k-octets" attribute.

3719 ~~Note: This attribute and the following two attributes ("job-impressions-completed" and "job-sheets-~~  
3720 ~~completed") are intended to be counters. That is, the value for a job that has not started processing MUST~~  
3721 ~~be 0. When the job's "job-state" is 'processing' or 'processing-stopped', this value is intended to contain the~~  
3722 ~~amount of the job that has been processed to the time at which the attributes are requested.~~

## 3723 4.3.18.2 job-impressions-completed (integer(0:MAX))

3724 This job attribute specifies the number of impressions completed for the job so far. For printing devices,  
3725 the impressions completed includes interpreting, marking, and stacking the output.

3726 ~~See the note in "job-k-octets-processed" which also applies to this attribute.~~

## 3727 4.3.18.3 job-media-sheets-completed (integer(0:MAX))

3728 This job attribute specifies the media-sheets completed marking and stacking for the entire job so far  
3729 whether those sheets have been processed on one side or on both.

3730 ~~See the note in "job-k-octets-processed" which also applies to this attribute.~~

## 3731 4.3.19 attributes-charset (charset)

3732 This REQUIRED attribute is populated using the value in the client supplied "attributes-charset" attribute in  
3733 the create request. It identifies the charset (coded character set and encoding method) used by any Job  
3734 attributes with attribute syntax 'text' and 'name' that were supplied by the client in the create request. See  
3735 Section 3.1.4 for a complete description of the "attributes-charset" operation attribute.

3736 This attribute does not indicate the charset in which the 'text' and 'name' values are stored internally in the  
3737 Job object. The internal charset is implementation-defined. The IPP object MUST convert from whatever  
3738 the internal charset is to that being requested in an operation as specified in Section 3.1.4.

## 3739 4.3.20 attributes-natural-language (naturalLanguage)

3740 This REQUIRED attribute is populated using the value in the client supplied "attributes-natural-language"  
3741 attribute in the create request. It identifies the natural language used for any Job attributes with attribute

3742 syntax 'text' and 'name' that were supplied by the client in the create request. See Section 3.1.4 for a  
3743 complete description of the "attributes-natural-language" operation attribute. See Sections 4.1.1.2 and  
3744 4.1.2.2 for how a Natural Language Override may be supplied explicitly for each 'text' and 'name' attribute  
3745 value that differs from the value identified by the "attributes-natural-language" attribute.

#### 3746 4.4 Printer Description Attributes

3747 These attributes form the attribute group called "printer-description". The following table summarizes  
3748 these attributes, their syntax, and whether or not they are REQUIRED for a Printer object to support. If  
3749 they are not indicated as REQUIRED, they are OPTIONAL. The maximum size in octets for 'text' and  
3750 'name' attributes is indicated in parentheses.

3751 Note: How these attributes are set by an Administrator is outside the scope of this ~~specification~~. IPP/1.1  
3752 document.

3881 4.4.1 printer-uri-supported (1setOf uri)

3882 This REQUIRED Printer attribute contains at least one URI for the Printer object. It OPTIONALLY  
3883 contains more than one URI for the Printer object. An administrator determines a Printer object's URI(s)  
3884 and configures this attribute to contain those URIs by some means outside the scope of IPP/1.0: this IPP/1.1  
3885 document. The precise format of this URI is implementation dependent and depends on the protocol. See  
3886 the next section two sections for a description of the "uri-security-supported" and "uri-authentication-  
3887 supported" attributes, both of which are the REQUIRED companion attributes to this "printer-uri-  
3888 supported" attribute. See section 2.4 on Printer object identity and section 8.2 on security and URIs for  
3889 more information.

3890 4.4.2 uri-authentication-supported (1setOf type2 keyword)

3891 This REQUIRED Printer attribute MUST have the same cardinality (contain the same number of values) as  
3892 the "printer-uri-supported" attribute. This attribute identifies the Client Authentication mechanism  
3893 associated with each URI listed in the "printer-uri-supported" attribute. The Printer object uses the specified

3894 mechanism to identify the authenticated user (see section 1.1). The "i th" value in "uri-authentication-  
3895 supported" corresponds to the "i th" value in "printer-uri-supported" and it describes the authentication  
3896 mechanisms used by the Printer when accessed via that URI. See [IPP-PRO] for more details on Client  
3897 Authentication.

3898 The following standard keyword values are defined:

3899 'none': There is no authentication mechanism associated with the URI. The Printer object assumes that  
3900 the authenticated user is "anonymous".

3901 'requesting-user-name': When a client performs an operation whose target is the associated URI, the  
3902 Printer object assumes that the authenticated user is specified by the "requesting-user-name"  
3903 Operation attribute (see section 1.1). If the "requesting-user-name" attribute is absent in a request,  
3904 the Printer object assumes that the authenticated user is "anonymous".

3905 'basic': When a client performs an operation whose target is the associated URI, the Printer object  
3906 challenges the client with HTTP basic authentication [RFC2617]. The Printer object assumes that  
3907 the authenticated user is the name received via the basic authentication mechanism.

3908 'digest': When a client performs an operation whose target is the associated URI, the Printer object  
3909 challenges the client with HTTP digest authentication [RFC2617]. The Printer object assumes that  
3910 the authenticated user is the name received via the digest authentication mechanism.

3911 'certificate': When a client performs an operation whose target is the associated URI, the Printer object  
3912 expects the client to provide a certificate. The Printer object assumes that the authenticated user is  
3913 the textual name contained within the certificate.

#### 3914 4.4.3 uri-security-supported (1setOf type2 keyword)

3915 This REQUIRED Printer attribute MUST have the same cardinality (contain the same number of values) as  
3916 the "printer-uri-supported" attribute. This attribute identifies the security mechanisms used for each URI  
3917 listed in the "printer-uri-supported" attribute. The "i th" value in "uri-security-supported" corresponds to  
3918 the "i th" value in "printer-uri-supported" and it describes the security mechanisms used for accessing the  
3919 Printer object via that URI. See [IPP-PRO] for more details on security mechanisms.

3920 The following standard keyword values are defined:

3921 'none': There are no secure communication channel protocols in use for the given URI.

3922 'ssl3': SSL3 [SSL] is the secure communications channel protocol in use for the given URI.

3923 'tls': TLS [RFC2246] is the secure communications channel protocol in use for the given URI.

3924

3925 This attribute is orthogonal to the definition of a Client Authentication mechanism. Specifically, 'none'  
3926 does not exclude Client Authentication. See section 4.4.2.

3927 Consider the following example. For a single Printer object, an administrator configures the "printer-uri-  
3928 supported", "uri-authentication-supported" and "uri-security-supported" attributes as follows:

3929 "printer-uri-supported": ~~'http://acme.com/open-use-printer', 'http://acme.com/restricted-use-printer',~~  
3930 ~~'http://acme.com/private-printer'~~xxx://acme.com/open-use-printer', xxx://acme.com/restricted-use-  
3931 printer', xxx://acme.com/private-printer'

3932 "uri-authentication-supported": 'none', 'digest', 'basic'

3933 "uri-security-supported": 'none', 'none', 'ssl3'tls'

3934

3935 Note: 'xxx' is not a valid scheme. See the IPP/1.1 "Transport and Encoding" document [IPP-PRO] for the  
3936 actual URI schemes to be used in object target attributes.

3937 In this case, one Printer object has three URIs.

- 3938 - For the first URI, ~~'http://acme.com/open-use-printer'~~,'xxx://acme.com/open-use-printer', the value  
3939 'none' in "uri-security-supported" indicates that there is no secure channel protocol configured to run  
3940 under HTTP. ~~The name implies that there is no Basic or Digest authentication being used, but it is~~  
3941 ~~up to the client to determine that while using HTTP~~value of 'none' in "uri-authentication-supported"  
3942 indicates that all users are 'anonymous'. There will be no challenge and the Printer will underneath  
3943 the IPP application protocol ignore "requesting-user-name".  
3944 - For the second URI, ~~'http://acme.com/restricted-use-printer'~~,'xxx://acme.com/restricted-use-printer',  
3945 the value 'none' in "uri-security-supported" indicates that there is no secure channel protocol  
3946 configured to run under HTTP. ~~In this case, although the name does imply that there is some sort of~~  
3947 ~~Basic or Digest authentication being used within HTTP, it is up to the~~The value of 'digest' in "uri-  
3948 authentication-supported" indicates that the Printer will issue a challenge and that the Printer will  
3949 use the name client to determine that while using HTTP and by processing any '401 Unauthorized'  
3950 HTTP error messages supplied by the digest mechanism to determine the authenticated user (see  
3951 section 1.1).  
3952 - For the third URI, ~~'http://acme.com/private-printer'~~,'ssl3'xxx://acme.com/private-printer', the  
3953 value 'tls' in "uri-security-supported" indicates that SSL3/TLS is being used to secure the channel.  
3954 The client SHOULD be prepared to use SSL3/TLS framing to negotiate an acceptable ciphersuite to  
3955 use while communicating with the Printer object. In this case, the name implies the use of a secure  
3956 communications channel, but the fact is made explicit by the presence of the 'ssl3'tls' value in "uri-  
3957 security-supported". The client does not need to resort to understanding which security it must use  
3958 by following naming conventions or by parsing the URI to determine which security mechanisms  
3959 are implied.  
3960 implied. The value of 'basic' in "uri-authentication-supported" indicates that the Printer will issue a  
3961 challenge and that the Printer will use the name supplied by the digest mechanism to determine the  
3962 authenticated user (see section 1.1). Because this challenge occurs in a tls session, the channel is  
3963 secure.

3964

3965 It is expected that many IPP Printer objects will be configured to support only one channel (either  
3966 configured to use SSL3 access or not), ~~and will therefore only ever~~TLS access or not) and only one  
3967 authentication mechanism. Such Printer objects only have one URI listed in the "printer-uri-supported"  
3968 attribute. No matter the configuration of the Printer object (whether it has only one URI or more than one  
3969 URI), a client MUST supply only one URI in the target "printer-uri" operation attribute.

#### 3970 4.4.4 printer-name (name(127))

3971 This REQUIRED Printer attribute contains the name of the Printer object. It is a name that is more end-  
3972 user friendly than a URI. An administrator determines a printer's name and sets this attribute to that name.

3973 This name may be the last part of the printer's URI or it may be unrelated. In non-US-English locales, a  
3974 name may contain characters that are not allowed in a URI.

#### 3975 4.4.5 printer-location (text(127))

3976 This Printer attribute identifies the location of the device. This could include things like: "in Room 123A,  
3977 second floor of building XYZ".

#### 3978 4.4.6 printer-info (text(127))

3979 This Printer attribute identifies the descriptive information about this Printer object. This could include  
3980 things like: "This printer can be used for printing color transparencies for HR presentations", or "Out of  
3981 courtesy for others, please print only small (1-5 page) jobs at this printer", or even "This printer is going  
3982 away on July 1, 1997, please find a new printer".

#### 3983 4.4.7 printer-more-info (uri)

3984 This Printer attribute contains a URI used to obtain more information about this specific Printer object. For  
3985 example, this could be an HTTP type URI referencing an HTML page accessible to a Web Browser. The  
3986 information obtained from this URI is intended for end user consumption. Features outside the scope of IPP  
3987 can be accessed from this URI. The information is intended to be specific to this printer instance and site  
3988 specific services (e.g. job pricing, services offered, end user assistance). The device manufacturer may  
3989 initially populate this attribute.

#### 3990 4.4.8 printer-driver-installer (uri)

3991 This Printer attribute contains a URI to use to locate the driver installer for this Printer object. This  
3992 attribute is intended for consumption by automata. The mechanics of print driver installation is outside the  
3993 scope of [IPP](#). this IPP/1.1 document. The device manufacturer may initially populate this attribute.

#### 3994 4.4.9 printer-make-and-model (text(127))

3995 This Printer attribute identifies the make and model of the device. The device manufacturer may initially  
3996 populate this attribute.

#### 3997 4.4.10 printer-more-info-manufacturer (uri)

3998 This Printer attribute contains a URI used to obtain more information about this type of device. The  
3999 information obtained from this URI is intended for end user consumption. Features outside the scope of  
4000 IPP can be accessed from this URI (e.g., latest firmware, upgrades, print drivers, optional features available,  
4001 details on color support). The information is intended to be germane to this printer without regard to site  
4002 specific modifications or services. The device manufacturer may initially populate this attribute.

4003 4.4.11 printer-state (type1 enum)

4004 This REQUIRED Printer attribute identifies the current state of the device. The "printer-state reasons"  
4005 attribute augments the "printer-state" attribute to give more detailed information about the Printer in the  
4006 given printer state.

4007 A Printer object need only update this attribute before responding to an operation which requests the  
4008 attribute; the Printer object NEED NOT update this attribute continually, since asynchronous event  
4009 notification is not part of ~~IPP/1.0~~.IPP/1.1. A Printer NEED NOT implement all values if they are not  
4010 applicable to a given implementation.

4011 The following standard enum values are defined:

4012 Value Symbolic Name and Description

4013  
4014 '3' 'idle': ~~If a Printer receives a job (whose required resources are ready) while in this state, such~~  
4015 ~~a job MUST transit into the 'processing' state immediately. If the "printer-state~~  
4016 ~~reasons" attribute contains any reasons, they MUST be reasons that would not~~  
4017 ~~prevent a job from transiting into the 'processing' state immediately, e.g., 'toner-low'.~~  
4018 ~~Note: if a Printer controls more than one output device, the above definition implies~~  
4019 ~~that a Printer is 'idle' if at least one output device is idle.~~

4020  
4021 ~~'4' 'processing': If a Printer receives a job (whose required resources are ready) while in this~~  
4022 ~~state, such a job MUST transit into the 'pending' state immediately. Such a job~~  
4023 ~~MUST transit into the 'processing' state only after jobs ahead of it complete. If the~~  
4024 ~~"printer-state-reasons" attribute contains any reasons, they MUST be reasons that do~~  
4025 ~~not prevent the current job from printing, e.g. 'toner-low'. Note: if a Printer controls~~  
4026 ~~more than one output device, the above definition implies that a Printer is~~  
4027 ~~'processing' if at least one output device is processing, and none is idle.~~

4028  
4029 ~~'5' 'stopped': If a Printer receives a job (whose required resources are ready) while in this state,~~  
4030 ~~such a job MUST transit into the 'pending' state immediately. Such a job MUST~~  
4031 ~~transit into the 'processing' state only after some human fixes the problem that~~  
4032 ~~stopped the printer and after jobs ahead of it complete processing. If supported, the~~  
4033 ~~"printer-state-reasons" attribute MUST contain at least one reason, e.g. 'media-jam',~~  
4034 ~~which prevents it from either processing the current job or transitioning a 'pending'~~  
4035 ~~job to the 'processing' state.~~

4036  
4037 ~~Note: if a Printer controls more than one output device, the above definition implies that a Printer is~~  
4038 ~~'stopped' only if all output devices are stopped. Also, it is tempting to define~~  
4039 ~~'stopped' as when a sufficient number of output devices are stopped and leave it to an~~  
4040 ~~implementation to define the sufficient number. But such a rule complicates the~~  
4041 ~~definition of 'stopped' and 'processing'. For example, with this alternate definition of~~  
4042 ~~'stopped', a job can move from 'pending' to 'processing' without human intervention,~~  
4043 ~~even though the Printer is stopped.~~Indicates that new jobs can start processing  
4044 without waiting.

4045 '4' 'processing': Indicates that jobs are processing; new jobs will wait before processing.

4046 '5' 'stopped': Indicates that no jobs can be processed and intervention is required.

4047 Values of "printer-state-reasons", such as 'spool-area-full' and 'stopped-partly', MAY be used to provide  
4048 further information.

#### 4049 4.4.12 printer-state-reasons (1setOf type2 keyword)

4050 This **REQUIRED** Printer attribute supplies additional detail about the device's state. Some of the these  
4051 value definitions indicate conformance requirements; the rest are OPTIONAL.

4052 Each keyword value MAY have a suffix to indicate its level of severity. The three levels are: report (least  
4053 severe), warning, and error (most severe).

- 4054 - '-report': This suffix indicates that the reason is a "report". An implementation may choose to omit  
4055 some or all reports. Some reports specify finer granularity about the printer state; others serve as a  
4056 precursor to a warning. A report **MUST** contain nothing that could affect the printed output.
- 4057 - '-warning': This suffix indicates that the reason is a "warning". An implementation may choose to omit  
4058 some or all warnings. Warnings serve as a precursor to an error. A warning **MUST** contain nothing  
4059 that prevents a job from completing, though in some cases the output may be of lower quality.
- 4060 - '-error': This suffix indicates that the reason is an "error". An implementation **MUST** include all  
4061 errors. If this attribute contains one or more errors, printer **MUST** be in the stopped state.

4063 If the implementation does not add any one of the three suffixes, all parties **MUST** assume that the reason is  
4064 an "error".

4065 If a Printer object controls more than one output device, each value of this attribute MAY apply to one or  
4066 more of the output devices. An error on one output device that does not stop the Printer object as a whole  
4067 MAY appear as a warning in the Printer's "printer-state-reasons attribute". If the "printer-state" for such a  
4068 Printer has a value of 'stopped', then there **MUST** be an error reason among the values in the "printer-state-  
4069 reasons" attribute.

4070 The following standard keyword values are defined:

4071 'other': The device has detected an error other than one listed in this document.

4072 'none': There are not reasons. This state reason is semantically equivalent to "printer-state-reasons"  
4073 without any value and **MUST** be used, since the 1setOf attribute syntax requires at least one value.

4074 'media-needed': A tray has run out of media.

4075 'media-jam': The device has a media jam.

4076 'moving-to-paused': Someone has paused the Printer object using the Pause-Printer operation (see  
4077 section 3.2.7) or other means, but the device(s) are taking an appreciable time to stop. Later, when  
4078 all output has stopped, the "printer-state" becomes 'stopped', and the 'paused' value replaces the  
4079 'moving-to-paused' value in the "printer-state-reasons" attribute. This value **MUST** be supported, if  
4080 the Pause-Printer operation is supported and the implementation takes significant time to pause a  
4081 device in certain circumstances.

- 4082 'paused': Someone has paused the Printer object using the Pause-Printer operation (see section 3.2.7) or  
4083 other means and the Printer object's "printer-state" is 'stopped'. In this state, a Printer MUST NOT  
4084 produce printed output, but it MUST perform other operations requested by a client. If a Printer had  
4085 been printing a job when the Printer was paused, the Printer MUST resume printing that job when  
4086 the Printer is no longer paused and leave no evidence in the printed output of such a pause. This  
4087 value MUST be supported, if the Pause-Printer operation is supported.
- 4088 'shutdown': Someone has removed a Printer object from service, and the device may be powered down  
4089 or physically removed. In this state, a Printer object MUST NOT produce printed output, and unless  
4090 the Printer object is realized by a print server that is still active, the Printer object MUST perform no  
4091 other operations requested by a client, including returning this value. If a Printer object had been  
4092 printing a job when it was shutdown, the Printer NEED NOT resume printing that job when the  
4093 Printer is no longer shutdown. If the Printer resumes printing such a job, it may leave evidence in  
4094 the printed output of such a shutdown, e.g. the part printed before the shutdown may be printed a  
4095 second time after the shutdown.
- 4096 'connecting-to-device': The Printer object has scheduled a job on the output device and is in the process  
4097 of connecting to a shared network output device (and might not be able to actually start printing the  
4098 job for an arbitrarily long time depending on the usage of the output device by other servers on the  
4099 network).
- 4100 'timed-out': The server was able to connect to the output device (or is always connected), but was unable  
4101 to get a response from the output device.
- 4102 'stopping': The Printer object is in the process of stopping the device and will be stopped in a while.  
4103 When the device is stopped, the Printer object will change the Printer object's state to 'stopped'. The  
4104 'stopping-warning' reason is never an error, even for a Printer with a single output device. When an  
4105 output-device ceases accepting jobs, the Printer will have this reason while the output device  
4106 completes printing.
- 4107 'stopped-partly': When a Printer object controls more than one output device, this reason indicates that  
4108 one or more output devices are stopped. If the reason is a report, fewer than half of the output  
4109 devices are stopped. If the reason is a warning, fewer than all of the output devices are stopped.
- 4110 'toner-low': The device is low on toner.
- 4111 ~~'marker-supply-low':~~ 'toner-empty': The device is ~~low on marker supply (ink, paint, etc.)~~ out of toner.
- 4112 'spool-area-full': The limit of persistent storage allocated for spooling has been ~~reached~~  
4113 reached. The Printer is temporarily unable to accept more jobs. The Printer will remove this value  
4114 when it is able to accept more jobs. This value SHOULD be used by a non-spooling Printer that  
4115 only accepts one or a small number jobs at a time or a spooling Printer that has filled the spool  
4116 space.
- 4117 'cover-open': One or more covers on the device are open.
- 4118 'interlock-open': One or more interlock devices on the printer are unlocked.
- 4119 'door-open': One or more doors on the device are open.
- 4120 'input-tray-missing': One or more input trays are not in the device.
- 4121 'media-low': At least one input tray is low on media.
- 4122 'media-empty': At least one input tray is empty.
- 4123 'output-tray-missing': One or more output trays are not in the device
- 4124 'output-area-almost-full': One or more output area is almost full (e.g. tray, stacker, collator).
- 4125 'output-area-full': One or more output area is full. (e.g. tray, stacker, collator)
- 4126 'marker-supply-low': The device is low on at least one marker supply. (e.g. toner, ink, ribbon)

4127 'marker-supply-empty: The device is out of at least one marker supply. (e.g. toner, ink, ribbon)  
4128 'marker-waste-almost-full': The device marker supply waste receptacle is almost full.  
4129 'marker-waste-full': The device marker supply waste receptacle is full.  
4130 'fuser-over-temp': The fuser temperature is above normal.  
4131 'fuser-under-temp': The fuser temperature is below normal.  
4132 'opc-near-eol': The optical photo conductor is near end of life.  
4133 'opc-life-over': The optical photo conductor is no longer functioning.  
4134 'developer-low': The device is low on developer.  
4135 'developer-empty': The device is out of developer.  
4136 'interpreter-resource-unavailable': An interpreter resource is unavailable (i.e. font, form)  
4137

#### 4138 4.4.13 printer-state-message (text(MAX))

4139 This Printer attribute specifies the additional information about the printer state and printer state reasons in  
4140 human readable text. If the Printer object supports this attribute, the Printer object MUST be able to  
4141 generate this message in any of the natural languages identified by the Printer's "generated-natural-  
4142 language-supported" attribute (see the "attributes-natural-language" operation attribute specified in Section  
4143 3.1.4.1).

#### 4144 4.4.14 ipp-versions-supported (1setOf type2 keyword)

4145 This REQUIRED attribute identifies the IPP protocol version(s) that this Printer supports, including major  
4146 and minor versions, i.e., the version numbers for which this Printer implementation meets the conformance  
4147 requirements. For version number validation, the Printer matches the (two-octet binary) "version-number"  
4148 parameter supplied by the client in each request (see sections 3.1.1 and 3.1.8) with the (US-ASCII) keyword  
4149 values of this attribute.

4150 The following standard keyword values are defined:

4151 '1.0': Meets the conformance requirement of IPP version 1.0 as specified in RFC 2566 [RFC2566] and  
4152 RFC 2565 [RFC2565] including any extensions registered according to Section 6 and any extension  
4153 defined in this version or any future version of the IPP "Model and Semantics" document or the IPP  
4154 "Encoding and Transport" document following the rules, if any, when the "version-number"  
4155 parameter is '1.0'.

4156 '1.1': Meets the conformance requirement of IPP version 1.1 as specified in this document and [IPP-  
4157 PRO] including any extensions registered according to Section 6 and any extension defined in any  
4158 future versions of the IPP "Model and Semantics" document or the IPP Encoding and Transport  
4159 document following the rules, if any, when the "version-number" parameter is '1.1'.

#### 4160 4.4.15 operations-supported (1setOf type2 enum)

4161 This REQUIRED Printer attribute specifies the set of supported operations for this Printer object and  
4162 contained Job objects.

4163 All This attribute is encoded as any other enum attribute syntax according to [IPP-PRO] as 32-bits.  
4164 However, all 32-bit enum values for this attribute MUST NOT exceed 0x00008FFF, since these same

4165 values are also passed in two octets in the "operation-id" parameter (see section 3.1.1) in each Protocol  
4166 request with the two high order octets omitted in order to indicate the operation being performed [IPP-  
4167 PRO].

4168 The following standard enum and "operation-id" (see section 3.1.2) values are defined:

4169	Value	Operation Name
4170	-----	-----
4171		
4172	0x0000	reserved, not used
4173	0x0001	reserved, not used
4174	0x0002	Print-Job
4175	0x0003	Print-URI
4176	0x0004	Validate-Job
4177	0x0005	Create-Job
4178	0x0006	Send-Document
4179	0x0007	Send-URI
4180	0x0008	Cancel-Job
4181	0x0009	Get-Job-Attributes
4182	0x000A	Get-Jobs
4183	0x000B	Get-Printer-Attributes
4184	<u>0x000C</u>	<u>Hold-Job</u>
4185	<u>0x000D</u>	<u>Release-Job</u>
4186	<u>0x000E</u>	<u>Restart-Job</u>
4187	<u>0x000F</u>	<u>reserved for a future operation</u>
4188	<u>0x0010</u>	<u>Pause-Printer</u>
4189	<u>0x0011</u>	<u>Resume-Printer</u>
4190	<u>0x0012</u>	<u>Purge-Jobs</u>
4191	<del>0x000C-0x3FFF</del> <u>0x0013-0x3FFF</u>	reserved for future operations
4192	0x4000-0x8FFF	reserved for private extensions

4194 ~~This~~The reserved block for private extensions allows for ~~certain~~ vendors to implement private extensions  
4195 that are guaranteed to not conflict with future registered extensions. However, there is no guarantee that  
4196 two or more private extensions will not conflict.

4197 4.4.16 multiple-document-jobs-supported (boolean)

4198 This Printer attribute indicates whether or not the Printer supports more than one document per job, i.e.,  
4199 more than one Send-Document or Send-Data operation with document data. If the Printer supports the  
4200 Create-Job and Send-Document operations (see section 3.2.4 and 3.3.1), it MUST support this attribute.

4201 4.4.17 charset-configured (charset)

4202 This REQUIRED Printer attribute identifies the charset that the Printer object has been configured to  
4203 represent 'text' and 'name' Printer attributes that are set by the operator, system administrator, or

4204 manufacturer, i.e., for "printer-name" (name), "printer-location" (text), "printer-info" (text), and "printer-  
4205 make-and-model" (text). Therefore, the value of the Printer object's "charset-configured" attribute MUST  
4206 also be among the values of the Printer object's "charset-supported" attribute.

#### 4207 4.4.18 charset-supported (1setOf charset)

4208 This REQUIRED Printer attribute identifies the set of charsets that the Printer and contained Job objects  
4209 support in attributes with attribute syntax 'text' and 'name'. At least the value 'utf-8' MUST be present, since  
4210 IPP objects MUST support the UTF-8 [RFC2044][RFC2279] charset. If a Printer object supports a charset,  
4211 it means that for all attributes of syntax 'text' and 'name' the IPP object MUST (1) accept the charset in  
4212 requests and return the charset in responses as needed.

4213 If more charsets than UTF-8 are supported, the IPP object MUST perform charset conversion between the  
4214 charsets as described in Section 3.1.4.2.

#### 4215 4.4.19 natural-language-configured (naturalLanguage)

4216 This REQUIRED Printer attribute identifies the natural language that the Printer object has been configured  
4217 to represent 'text' and 'name' Printer attributes that are set by the operator, system administrator, or  
4218 manufacturer, i.e., for "printer-name" (name), "printer-location" (text), "printer-info" (text), and "printer-  
4219 make-and-model" (text). When returning these Printer attributes, the Printer object MAY return them in the  
4220 configured natural language specified by this attribute, instead of the natural language requested by the  
4221 client in the "attributes-natural-language" operation attribute. See Section 3.1.4.1 for the specification of  
4222 the OPTIONAL multiple natural language support. Therefore, the value of the Printer object's "natural-  
4223 language-configured" attribute MUST also be among the values of the Printer object's "generated-natural-  
4224 language-supported" attribute.

#### 4225 4.4.20 generated-natural-language-supported (1setOf naturalLanguage)

4226 This REQUIRED Printer attribute identifies the natural language(s) that the Printer object and contained  
4227 Job objects support in attributes with attribute syntax 'text' and 'name'. The natural language(s) supported  
4228 depends on implementation and/or configuration. Unlike charsets, IPP objects MUST accept requests with  
4229 any natural language or any Natural Language Override whether the natural language is supported or not.

4230 If a Printer object supports a natural language, it means that for any of the attributes for which the Printer or  
4231 Job object generates messages, i.e., for the "job-state-message" and "printer-state-message" attributes and  
4232 Operation Messages (see Section 3.1.5) in operation responses, the Printer and Job objects MUST be able  
4233 to generate messages in any of the Printer's supported natural languages. See section 3.1.4 for the  
4234 [specification](#) [definition](#) of 'text' and 'name' attributes in operation requests and responses.

4235 Note: A Printer object that supports multiple natural languages, often has separate catalogs of messages,  
4236 one for each natural language supported.

4237 4.4.21 document-format-default (mimeMediaType)

4238 This REQUIRED Printer attribute identifies the document format that the Printer object has been  
4239 configured to assume if the client does not supply a "document-format" operation attribute in any of the  
4240 operation requests that supply document data. The standard values for this attribute are Internet Media  
4241 types (sometimes called MIME types). For further details see the description of the 'mimeMediaType'  
4242 attribute syntax in Section 4.1.9.

4243 4.4.22 document-format-supported (1setOf mimeMediaType)

4244 This REQUIRED Printer attribute identifies the set of document formats that the Printer object and  
4245 contained Job objects can support. For further details see the description of the 'mimeMediaType' attribute  
4246 syntax in Section 4.1.9.

4247 4.4.23 printer-is-accepting-jobs (boolean)

4248 This REQUIRED Printer attribute indicates whether the printer is currently able to accept jobs, i.e., is  
4249 accepting Print-Job, Print-URI, and Create-Job requests. If the value is 'true', the printer is accepting jobs.  
4250 If the value is 'false', the Printer object is currently rejecting any jobs submitted to it. In this case, the  
4251 Printer object returns the 'server-error-not-accepting-jobs' status code.

4252 ~~Note:~~ This value is independent of the "printer-state" and "printer-state-reasons" attributes because its value  
4253 does not affect the current job; rather it affects future jobs. This ~~attribute may cause~~ attribute, when 'false',  
4254 causes the Printer to reject jobs even when the "printer-state" is 'idle' ~~or it may cause~~ or, when 'true', causes  
4255 the Printer object to accept jobs even when the "printer-state" is 'stopped'.

4256 4.4.24 queued-job-count (integer(0:MAX))

4257 This ~~RECOMMENDED~~ REQUIRED Printer attribute contains a count of the number of jobs that are either  
4258 'pending', 'processing', 'pending-held', or 'processing-stopped' and is set by the Printer object.

4259 4.4.25 printer-message-from-operator (text(127))

4260 This Printer attribute provides a message from an operator, system administrator or "intelligent" process to  
4261 indicate to the end user information or status of the printer, such as why it is unavailable or when it is  
4262 expected to be available.

4263 4.4.26 color-supported (boolean)

4264 This Printer attribute identifies whether the device is capable of any type of color printing at all, including  
4265 highlight color. All document instructions having to do with color are embedded within the document PDL  
4266 (none are external IPP attributes in ~~IPP/1.0~~ IPP/1.1).

4267 Note: end-users are able to determine the nature and details of the color support by querying the "printer-  
4268 more-info-manufacturer" Printer attribute.

4269 4.4.27 reference-uri-schemes-supported (1setOf uriScheme)

4270 This Printer attribute specifies which URI schemes are supported for use in the "document-uri" operation  
4271 attribute of the Print-URI or Send-URI operation. If a Printer object supports these optional operations, it  
4272 MUST support the "reference-uri-schemes-supported" Printer attribute with at least the following schemed  
4273 URI value:

4274 'ftp': The Printer object will use an FTP 'get' operation as defined in RFC 2228 [RFC2228] using FTP  
4275 URLs as defined by [RFC2396] and [RFC2316].  
4276

4277 The Printer object MAY OPTIONALLY support other URI schemes (see section 4.1.6).

4278 4.4.28 pdl-override-supported (type2 keyword)

4279 This REQUIRED Printer attribute expresses the ability for a particular Printer implementation to either  
4280 attempt to override document data instructions with IPP attributes or not.

4281 This attribute takes on the following values:

- 4282 - 'attempted': This value indicates that the Printer object attempts to make the IPP attribute values take  
4283 precedence over embedded instructions in the document data, however there is no guarantee.
- 4284 - 'not-attempted': This value indicates that the Printer object makes no attempt to make the IPP attribute  
4285 values take precedence over embedded instructions in the document data.  
4286

4287 Section 15 contains a full description of how this attribute interacts with and affects other IPP attributes,  
4288 especially the "ipp-attribute-fidelity" attribute.

4289 4.4.29 printer-up-time (integer(1:MAX))

4290 This REQUIRED Printer attribute indicates the amount of time (in seconds) that this ~~Printer~~ instance ~~of this~~  
4291 ~~Printer implementation~~ has been up and running. The value is a monotonically increasing value starting  
4292 from 1 when the Printer object is started-up (initialized, booted, etc.). This value is used to populate the  
4293 Event Time Job Description Job attributes "time-at-creation", "time-at-processing", and "~~time-at-~~  
4294 ~~completed~~". ~~These time values are all measured in seconds and all have meaning only relative to this~~  
4295 ~~attribute, "printer-up-time". The value is a monotonically increasing value starting from 1 when the Printer~~  
4296 ~~object is started-up (initialized, booted, etc.).~~ "time-at-completed" (see section 4.3.14).

4297 If the Printer object goes down at some value 'n', and comes back up, the implementation MAY:

- 4298 1. Know how long it has been down, and resume at some value greater than 'n', or
- 4299 2. Restart from 1.  
4300

4301 ~~In the first case, the Printer SHOULD not tweak any existing related Job attributes ("time-at-creation",~~  
4302 ~~"time-at-processing", and "time-at-completed"). In the second case, the Printer object SHOULD reset those~~  
4303 ~~attributes to 0. If a client queries a time-related Job attribute and finds the value to be 0, the client MUST~~

4304 ~~assume that the Job was submitted in some life other than the Printer's current life.~~ In other words, if the  
4305 device or devices that the Printer object is representing are restarted or power cycled, the Printer object  
4306 MAY continue counting this value or MAY reset this value to 1 depending on implementation. However,  
4307 if the Printer object software ceases running, and restarts without knowing the last value for "printer-up-  
4308 time", the implementation MUST reset this value to 1. If this value is reset and the Printer has persistent  
4309 jobs, the Printer MUST reset the "time-at-xxx(integer) Event Time Job Description attributes according to  
4310 Section 4.3.14. An implementation MAY use both implementation alternatives, depending on warm versus  
4311 cold start, respectively.

#### 4312 4.4.30 printer-current-time (dateTime)

4313 This Printer attribute indicates the current ~~absolute wall clock~~ date and time. ~~If an implementation supports~~  
4314 ~~this attribute, then a client could calculate the absolute wall clock time each Job's~~ This value is used to  
4315 populate the Event Time Job Description attributes: "time-at-creation", "time-at-processing", and "time-at-  
4316 completed" attributes by using both "printer-up-time" and this attribute, "printer-current-time". (see Section  
4317 4.3.14).

4318 ~~If an implementation does not support this attribute, a client can only calculate the relative time of certain~~  
4319 ~~events based on the REQUIRED "printer-up-time" attribute.~~

4320 The date and time is obtained on a "best efforts basis" and does not have to be that precise in order to work  
4321 in practice. A Printer implementation sets the value of this attribute by obtaining the date and time via  
4322 some implementation-dependent means, such as getting the value from a network time server, initialization  
4323 at time of manufacture, or setting by an administrator. See [IPP-IIG] for examples. If an implementation  
4324 supports this attribute and the implementation knows that it has not yet been set, then the implementation  
4325 MUST return the value of this attribute using the out-of-band 'no-value' meaning not configured. See the  
4326 beginning of section 4.1.

4327 The time zone of this attribute NEED NOT be the time zone used by people located near the Printer object  
4328 or device. The client MUST NOT expect that the time zone of any received 'dateTime' value to be in the  
4329 time zone of the client or in the time zone of the people located near the printer.

4330 The client SHOULD display any dateTime attributes to the user in client local time by converting the  
4331 'dateTime' value returned by the server to the time zone of the client, rather than using the time zone  
4332 returned by the Printer in attributes that use the 'dateTime' attribute syntax.

#### 4333 4.4.31 multiple-operation-time-out (integer(1:MAX))

4334 This Printer attributes identifies the minimum time (in seconds) that the Printer object waits for additional  
4335 Send-Document or Send-URI operations to follow a still-open multi-document Job object before taking  
4336 any recovery actions, such as the ones indicated in section 3.3.1. If the Printer object supports the Create-  
4337 Job and Send-Document operations (see section 3.2.4 and 3.3.1), it MUST support this attribute.

4338 It is RECOMMENDED that vendors supply a value for this attribute that is between 60 and 240 seconds.  
4339 An implementation MAY allow a system administrator to set this attribute (by means outside this IPP/1.1  
4340 document). If so, the system administrator MAY be able to set values outside this range.

4341 4.4.32 compression-supported (1setOf type3 keyword)

4342 This **REQUIRED** Printer attribute identifies the set of supported compression algorithms for document  
4343 data. Compression only applies to the document data; compression does not apply to the encoding of the  
4344 IPP operation itself. The supported values are used to validate the client supplied "compression" operation  
4345 attributes in Print-Job, Send-Document, and Send-URI requests.

4346 Standard values are :

4347 'none': no compression is used.  
4348 'deflate': ZIP public domain inflate/deflate) compression technology  
4349 'gzip' GNU zip compression technology described in RFC 1952 [RFC1952].  
4350 'compress': UNIX compression technology  
4351

4352 4.4.33 job-k-octets-supported (rangeOfInteger(0:MAX))

4353 This Printer attribute specifies the upper and lower bounds of total sizes of jobs in K octets, i.e., in units of  
4354 1024 octets. The supported values are used to validate the client supplied "job-k-octets" operation attributes  
4355 in create requests. The corresponding job description attribute "job-k-octets" is defined in section 4.3.17.1.

4356 4.4.34 job-impressions-supported (rangeOfInteger(0:MAX))

4357 This Printer attribute specifies the upper and lower bounds for the number of impressions per job. The  
4358 supported values are used to validate the client supplied "job-impressions" operation attributes in create  
4359 requests. The corresponding job description attribute "job-impressions" is defined in section 0.

4360 4.4.35 job-media-sheets-supported (rangeOfInteger(0:MAX))

4361 This Printer attribute specifies the upper and lower bounds for the number of media sheets per job. The  
4362 supported values are used to validate the client supplied "job-media-sheets" operation attributes in create  
4363 requests. The corresponding Job attribute "job-media-sheets" is defined in section 0.

4364 4.4.36 pages-per-minute (integer(0:MAX))

4365 This Printer attributes specifies the nominal number of pages per minute to the nearest whole number which  
4366 may be generated by this printer (e.g., simplex, black-and-white). This attribute is informative, not a  
4367 service guarantee. Generally, it is the value used in the marketing literature to describe the device.

4368 A value of 0 indicates a device that takes more than two minutes to process a page.

4369 4.4.37 pages-per-minute-color (integer(0:MAX))

4370 This Printer attribute specifies the nominal number of pages per minute to the nearest whole number which  
4371 may be generated by this printer when printing color (e.g., simplex, color). For purposes of this attribute,  
4372 "color" means the same as for the "color-supported" attribute, namely, the device is capable of any type of  
4373 color printing at all, including highlight color. This attribute is informative, not a service guarantee.  
4374 Generally, it is the value used in the marketing literature to describe the color capabilities of this device.

4375 A value of 0 indicates a device that takes more than two minutes to process a page.

4376 If a color device has several color modes, it MAY use the pages-per-minute value for this attribute that  
4377 corresponds to the mode that produces the highest number.

4378 Black and white only printers MUST NOT support this attribute. If this attribute is present, then the "color-  
4379 supported" Printer description attribute MUST be present and have a 'true' value.

4380 The values of these two attributes returned by the Get-Printer-Attributes operation MAY be affected by the  
4381 "document-format" attribute supplied by the client in the Get-Printer-Attributes request. In other words, the  
4382 implementation MAY have different speeds depending on the document format being processed. See  
4383 section 3.2.5.1 Get-Printer-Attributes.

4384 5. Conformance

4385 This section describes conformance issues and requirements. This document introduces model entities such  
4386 as objects, operations, attributes, attribute syntaxes, and attribute values. These conformance sections  
4387 describe the conformance requirements which apply to these model entities.

4388 5.1 Client Conformance Requirements

4389 This section describes the conformance requirements for a client (see section 2.1), whether it be:

- 4390 1. contained within software controlled by an end user, e.g. activated by the "Print" menu item in an  
4391 application that sends IPP requests or  
4392 2. the print server component that sends IPP requests to either an output device or another  
4393 "downstream" print server.

4394 A conforming client MUST support all REQUIRED operations as defined in this document. For each  
4395 attribute included in an operation request, a conforming client MUST supply a value whose type and value  
4396 syntax conforms to the requirements of the Model document as specified in Sections 3 and 4. A  
4397 conforming client MAY supply any registered extensions and/or private extensions in an operation request,  
4398 as long as they meet the requirements in Section 1.1.

4399 Otherwise, there are no conformance requirements placed on the user interfaces provided by IPP clients or  
4400 their applications. For example, one application might not allow an end user to submit multiple documents  
4401 per job, while another does. One application might first query a Printer object in order to supply a graphical  
4402 user interface (GUI) dialogue box with supported and default values whereas a different implementation  
4403 might not.

4404 When sending a request, an IPP client NEED NOT supply any attributes that are indicated as  
4405 OPTIONALLY supplied by the client.

4406 A client MUST be able to accept any of the attribute syntaxes defined in Section 4.1, including their full  
4407 range, that may be returned to it in a response from a Printer object. In particular for each attribute that the  
4408 client supports whose attribute syntax is 'text', the client MUST accept and process both the  
4409 'textWithoutLanguage' and 'textWithLanguage' forms. Similarly, for each attribute that the client supports  
4410 whose attribute syntax is 'name', the client MUST accept and process both the 'nameWithoutLanguage' and  
4411 'nameWithLanguage' forms. For presentation purposes, truncation of long attribute values is not  
4412 recommended. A recommended approach would be for the client implementation to allow the user to scroll  
4413 through long attribute values.

4414 A ~~query~~ response ~~may~~ MAY contain attribute groups, attributes, ~~and values~~ attribute syntaxes, values, and  
4415 status codes that the client does not expect. Therefore, a client implementation MUST gracefully handle  
4416 such responses and not refuse to inter-operate with a conforming Printer that is returning ~~extended~~ registered  
4417 or private ~~attributes and/or extensions, including~~ attribute values ~~groups, attributes, attribute syntaxes,~~  
4418 attribute values, and status codes that conform to Section 1.1. Clients may choose to ignore any parameters,  
4419 attributes, attribute syntaxes, or values that they do not understand.

4420 While a client is sending data to a printer, it SHOULD do its best to prevent a channel from being closed by  
4421 a lower layer when the channel is blocked (i.e. flow-controlled off) for whatever reason, e.g. 'out of paper'  
4422 or 'job ahead hasn't freed up enough memory'. However, the layer that launched the print submission (e.g.  
4423 an end user) MAY close the channel in order to cancel the job. When a client closes a channel, a Printer  
4424 MAY print all or part of the received portion of the document. See the "Encoding and Transport" document  
4425 [IPP-PRO] for more details.

4426 A client MUST support Client Authentication as defined in the IPP/1.1 Encoding and Transport document  
4427 [IPP-PRO]. A client SHOULD support Operation Privacy and Server Authentication as defined in the  
4428 IPP/1.1 Encoding and Transport document [IPP-PRO]. See also section 8 of this document.

## 4429 5.2 IPP Object Conformance Requirements

4430 This section specifies the conformance requirements for conforming implementations ~~with respect to~~  
4431 ~~objects, operations, and attributes~~ of IPP objects (see section 2). These requirements apply to an IPP object  
4432 whether it is:

4433 (1) an (embedded) device component that accepts IPP requests and controls the device or

4434 (2) a component of a print server that accepts IPP requests (where the print server control one or  
4435 more networked devices using IPP or other protocols).

4436 5.2.1 Objects

4437 Conforming implementations MUST implement all of the model objects as defined in this  
4438 specification document in the indicated sections:

4439 Section 2.1 - Printer Object

4440 Section 2.2 - Job Object

4441

4442 5.2.2 Operations

4443 Conforming IPP object implementations MUST implement all of the REQUIRED model operations,  
4444 including REQUIRED responses, as defined in this specification document in the indicated sections:

4445 For a Printer object:

4446	Print-Job (section 3.2.1)	REQUIRED
4447	Print-URI (section 3.2.2)	OPTIONAL
4448	Validate-Job (section 3.2.3)	REQUIRED
4449	Create-Job (section 3.2.4)	OPTIONAL
4450	Get-Printer-Attributes (section 3.2.5)	REQUIRED
4451	Get-Jobs (section 3.2.6)	REQUIRED
4452	<u>Pause-Printer (section 3.2.7)</u>	<u>OPTIONAL</u>
4453	<u>Resume-Printer (section 3.2.8)</u>	<u>OPTIONAL</u>
4454	<u>Purge-Jobs (section 3.2.9)</u>	<u>OPTIONAL</u>

4455

4456 For a Job object:

4457	Send-Document (section 3.3.1)	OPTIONAL
4458	Send-URI (section 3.3.2)	OPTIONAL
4459	Cancel-Job (section 3.3.3)	REQUIRED
4460	Get-Job-Attributes (section 3.3.4)	REQUIRED
4461	<u>Hold-Job (section 3.3.5)</u>	<u>OPTIONAL</u>
4462	<u>Release-Job (section 3.3.6)</u>	<u>OPTIONAL</u>
4463	<u>Restart-Job (section 3.3.7)</u>	<u>OPTIONAL</u>

4464

4465 Conforming IPP objects MUST support all REQUIRED operation attributes and all values of such  
4466 attributes if so indicated in the description. Conforming IPP objects MUST ignore all unsupported or  
4467 unknown operation attributes or operation attribute groups received in a request, but MUST reject a request  
4468 that contains a supported operation attribute that contains an unsupported value.

4469 Conforming IPP objects MAY return operation responses that contain attributes groups, attributes names,  
4470 attribute syntaxes, attribute values, and status codes that are extensions to this standard. The additional  
4471 attribute groups MAY occur in any order.

4472 The following section on object attributes specifies the support required for object attributes.

### 4473 5.2.3 IPP Object Attributes

4474 Conforming IPP objects MUST support all of the REQUIRED object attributes, as defined in this  
4475 specification document in the indicated sections.

4476 If an object supports an attribute, it MUST support only those values specified in this document or through  
4477 the extension mechanism described in section 5.2.4. It MAY support any non-empty subset of these values.  
4478 That is, it MUST support at least one of the specified values and at most all of them.

### 4479 5.2.4 Versions

4480 IPP/1.1 clients MUST meet the conformance requirements for clients specified in this document and [IPP-  
4481 PRO]. IPP/1.1 clients MUST send requests containing a "version-number" parameter with a '1.1' value.

4482 IPP/1.1 Printer and Job objects MUST meet the conformance requirements for IPP objects specified in this  
4483 document and [IPP-PRO]. IPP/1.1 objects MUST accept requests containing a "version-number"  
4484 parameter with a '1.1' value (or reject the request if the operation is not supported).

4485 It is beyond the scope of this specification to mandate conformance with previous versions. IPP/1.1 was  
4486 deliberately designed, however, to make supporting previous versions easy. It is worth noting that, at the  
4487 time of composing this specification (1999), we would expect IPP/1.1 Printer implementations to:

4488 understand any valid request in the format of IPP/1.0, or 1.1;

4489 respond appropriately with a response containing the same "version-number" parameter value used  
4490 by the client in the request.

4491 And we would expect IPP/1.1 clients to:

4492 understand any valid response in the format of IPP/1.0, or 1.1.

4493 It is recommended that IPP/1.1 clients try supplying alternate version numbers if they receive a 'server-  
4494 error-version-not-supported' error return in a response.

4495 -

### 4496 5.2.5 Extensions

4497 A conforming IPP object MAY support registered extensions and private extensions, as long as they meet  
4498 the requirements specified in Section 1.1.

4499 For each attribute included in an operation response, a conforming IPP object MUST return a value whose  
4500 type and value syntax conforms to the requirement of the Model document as specified in Sections 3 and 4.

4501 5.2.6 Attribute Syntaxes

4502 An IPP object MUST be able to accept any of the attribute syntaxes defined in Section 4.1, including their  
4503 full range, in any operation in which a client may supply attributes or the system administrator may  
4504 configure attributes (by means outside the scope of ~~IPP/1.0~~this IPP/1.1 document). In particular for each  
4505 attribute that the IPP object supports whose attribute syntax is 'text', the IPP object MUST accept and  
4506 process both the 'textWithoutLanguage' and 'textWithLanguage' forms. Similarly, for each attribute that the  
4507 IPP object supports whose attribute syntax is 'name', the IPP object MUST accept and process both the  
4508 'nameWithoutLanguage' and 'nameWithLanguage' forms. Furthermore, an IPP object MUST return  
4509 attributes to the client in operation responses that conform to the syntax specified in Section 4.1, including  
4510 their full range if supplied previously by a client.

4511 5.2.7 Security

4512 An IPP Printer implementation SHOULD contain support for Client Authentication as defined in the  
4513 IPP/1.1 Encoding and Transport document [IPP-PRO]. A Printer implementation MAY allow an  
4514 administrator to configure the Printer so that all, some, or none of the users are authenticated. See also  
4515 section 8 of this document.

4516 An IPP Printer implementation SHOULD contain support for Operation Privacy and Server Authentication  
4517 as defined in the IPP/1.1 Encoding and Transport document [IPP-PRO]. A Printer implementation MAY  
4518 allow an administrator to configure the degree of support for Operation Privacy and Server Authentication.  
4519 See also section 8 of this document.

4520 Security MUST NOT be compromised when a client supplies a lower "version-number" parameter in a  
4521 request. For example, if an IPP/1.1 conforming Printer object accepts version '1.0' requests and is  
4522 configured to enforce Digest Authentication, it MUST do the same for a version '1.0' request.

4523 5.3 Charset and Natural Language Requirements

4524 All clients and IPP objects MUST support the 'utf-8' charset as defined in section 4.1.7.

4525 IPP objects MUST be able to accept any client request which correctly uses the "attributes-natural-  
4526 language" operation attribute or the Natural Language Override mechanism on any individual attribute  
4527 whether or not the natural language is supported by the IPP object. If an IPP object supports a natural  
4528 language, then it MUST be able to translate (perhaps by table lookup) all generated 'text' or 'name' attribute  
4529 values into one of the supported languages (see section 3.1.4). That is, the IPP object that supports a  
4530 natural language NEED NOT be a general purpose translator of any arbitrary 'text' or 'name' value supplied  
4531 by the client into that natural language. However, the object MUST be able to translate (automatically  
4532 generate) any of its own attribute values and messages into that natural language.

## 5.4 Security Conformance Requirements

~~Conforming IPP Printer objects MAY support Secure Socket Layer Version 3 (SSL3) [SSL] access, support access without SSL3 or support both means of access.~~

~~Conforming IPP clients SHOULD support SSL3 access and non-SSL3 access. Note: This client requirement to support both means that conforming IPP clients will be able to inter-operate with any IPP Printer object.~~

~~For a detailed discussion of security considerations and the IPP application security profile required for SSL3 support, see section 8.~~

## 6. IANA Considerations (registered and private extensions)

This section describes how IPP can be extended to allow the following registered and private extensions to IPP:

1. keyword attribute values
2. enum attribute values
3. attributes
4. attribute syntaxes
5. operations
6. attribute groups
7. status codes

Extensions registered for use with [IPP/1.0](#) [IPP/1.1](#) are OPTIONAL for client and IPP object conformance to the ~~IPP/1.0 Model specification.~~ [IPP/1.1 Model document.](#)

These extension procedures are aligned with the guidelines as set forth by the IESG [IANA-CON]. Section 11 describes how to propose new registrations for consideration. IANA will reject registration proposals that leave out required information or do not follow the appropriate format described in Section 11. [IPP/1.1](#) may also be extended by an appropriate RFC that specifies any of the above extensions.

### 6.1 Typed 'keyword' and 'enum' Extensions

IPP allows for 'keyword' and 'enum' extensions (see sections 4.1.2.3 and 4.1.4). This document uses prefixes to the 'keyword' and 'enum' basic attribute syntax type in order to communicate extra information to the reader through its name. This extra information is not represented in the protocol because it is unimportant to a client or Printer object. The list below describes the prefixes and their meaning.

"type1": ~~The~~[This](#) IPP specification [document](#) must be revised to add a new keyword or a new enum. No private keywords or enums are allowed.

4566 "type2": Implementers can, at any time, add new keyword or enum values by proposing the complete  
4567 specification to IANA:

4568  
4569 iana@iana.org

4570  
4571 IANA will forward the registration proposal to the IPP Designated Expert who will review the  
4572 proposal with a mailing list that the Designated Expert keeps for this purpose. Initially, that list will  
4573 be the mailing list used by the IPP WG:

4574  
4575 ipp@pwg.org

4576  
4577 even after the IPP WG is disbanded as permitted by [IANA-CON]. The IPP Designated Expert is  
4578 appointed by the IESG Area Director responsible for IPP, according to [IANA-CON].

4579  
4580 When a type2 keyword or enum is approved, the IPP Designated Expert becomes the point of  
4581 contact for any future maintenance that might be required for that registration.

4582  
4583 "type3": Implementers can, at any time, add new keyword and enum values by submitting the complete  
4584 specification to IANA as for type2 who will forward the proposal to the IPP Designated Expert.  
4585 While no additional technical review is required, the IPP Designated Expert may, at his/her  
4586 discretion, forward the proposal to the same mailing list as for type2 registrations for advice and  
4587 comment.

4588  
4589 When a type3 keyword or enum is approved by the IPP Designated Expert, the original proposer  
4590 becomes the point of contact for any future maintenance that might be required for that registration.  
4591

4592 For type2 and type3 keywords, the proposer includes the name of the keyword in the registration proposal  
4593 and the name is part of the technical review.

4594 After type2 and type3 enums specifications are approved, the IPP Designated Expert in consultation with  
4595 IANA assigns the next available enum number for each enum value.

4596 IANA will publish approved type2 and type3 keyword and enum attributes value registration specifications  
4597 in:

4598 ftp.isi.edu/iana/assignments/ipp/attribute-values/xxx/yyy.txt

4599 where xxx is the attribute name that specifies the initial values and yyy.txt is a descriptive file name that  
4600 contains one or more enums or keywords approved at the same time. For example, if several additional  
4601 enums for stapling are approved for use with the "finishings" attribute (and "finishings-default" and  
4602 "finishings-supported" attributes), IANA will publish the additional values in the file:

4603 ftp.isi.edu/iana/assignments/ipp/attribute-values/finishings/stapling.txt-

4604 Note: Some attributes are defined to be: 'type3 keywords' | 'name' which allows for attribute values to be  
4605 extended by a site administrator with administrator defined names. Such names are not registered with  
4606 IANA.

4607 By definition, each of the three types above assert some sort of registry or review process in order for  
4608 extensions to be considered valid. Each higher numbered level (1, 2, 3) tends to be decreasingly less  
4609 stringent than the previous level. Therefore, any typeN value MAY be registered using a process for some  
4610 typeM where M is less than N, however such registration is NOT REQUIRED. For example, a type3 value  
4611 MAY be registered in a type 1 manner (by being included in a future version of an IPP specification),  
4612 however, it is NOT REQUIRED.

4613 This specification document defines keyword and enum values for all of the above types, including type3  
4614 keywords.

4615 For private (unregistered) keyword extensions, implementers SHOULD use keywords with a suitable  
4616 distinguishing prefix, such as "xxx-" where xxx is the (lowercase) fully qualified company name registered  
4617 with IANA for use in domain names [RFC1035]. For example, if the company XYZ Corp. had obtained  
4618 the domain name "XYZ.com", then a private keyword 'abc' would be: 'xyz.com-abc'.

4619 Note: RFC 1035 [RFC1035] indicates that while upper and lower case letters are allowed in domain names,  
4620 no significance is attached to the case. That is, two names with the same spelling but different case are to  
4621 be treated as if identical. Also, the labels in a domain name must follow the rules for ARPANET host  
4622 names: They must start with a letter, end with a letter or digit, and have as interior characters only letters,  
4623 digits, and hyphen. Labels must be 63 characters or less. Labels are separated by the "." character.

4624 For private (unregistered) enum extension, implementers MUST use values in the reserved integer range  
4625 which is  $2^{30}$  to  $2^{31}-1$ .

## 4626 6.2 Attribute Extensibility

4627 Attribute names are type2 keywords. Therefore, new attributes may be registered and have the same status  
4628 as attributes in this document by following the type2 extension rules. For private (unregistered) attribute  
4629 extensions, implementers SHOULD use keywords with a suitable distinguishing prefix as described in  
4630 Section 6.1.

4631 IANA will publish approved attribute registration specifications as separate files:

4632 `ftp.isi.edu/iana/assignments/ipp/attributes/xxx-yyy.txt`

4633 where "xxx-yyy" is the new attribute name.

4634 If a new Printer object attribute is defined and its values can be affected by a specific document format, its  
4635 specification needs to contain the following sentence:

4636 "The value of this attribute returned in a Get-Printer-Attributes response MAY depend on the  
4637 "document-format" attribute supplied (see Section 3.2.5.1)."

4638 If the specification does not, then its value in the Get-Printer-Attributes response MUST NOT depend on  
4639 the "document-format" supplied in the request. When a new Job Template attribute is registered, the value  
4640 of the Printer attributes MAY vary with "document-format" supplied in the request without the  
4641 specification having to indicate so.

### 4642 6.3 Attribute Syntax Extensibility

4643 Attribute syntaxes are like type2 enums. Therefore, new attribute syntaxes may be registered and have the  
4644 same status as attribute syntaxes in this document by following the type2 extension rules described in  
4645 Section 6.1. The value codes that identify each of the attribute syntaxes are assigned in the [Encoding and  
4646 Transport](#) ["Encoding and Transport" specification document](#) [IPP-PRO], including a designated range for  
4647 private, experimental use.

4648 For attribute syntaxes, the IPP Designated Expert in consultation with IANA assigns the next attribute  
4649 syntax code in the appropriate range as specified in [IPP-PRO]. IANA will publish approved attribute  
4650 syntax registration specifications as separate files:

4651 `ftp.isi.edu/iana/assignments/ipp/attribute-syntaxes/xxx-yyy.txt`

4652 where 'xxx-yyy' is the new attribute syntax name.

### 4653 6.4 Operation Extensibility

4654 Operations may also be registered following the type2 procedures described in Section 6.1, though major  
4655 new operations will usually be done by a new standards track RFC that augments this document. For  
4656 private (unregistered) operation extensions, implementers MUST use the range for the "operation-id" in  
4657 requests specified in Section 4.4.15 "operations-supported" Printer attribute.

4658 For operations, the IPP Designated Expert in consultation with IANA assigns the next operation-id code as  
4659 specified in Section 4.4.15. IANA will publish approved operation registration specifications as separate  
4660 files:

4661 `ftp.isi.edu/iana/assignments/ipp/operations/Xxx-Yyy.txt`

4662 where "Xxx-Yyy" is the new operation name.

### 4663 6.5 Attribute Groups

4664 Attribute groups passed in requests and responses may be registered following the type2 procedures  
4665 described in Section 6.1. The tags that identify each of the attribute groups are assigned in [IPP-PRO].

4666 For attribute groups, the IPP Designated Expert in consultation with IANA assigns the next attribute group  
4667 tag code in the appropriate range as specified in [IPP-PRO]. IANA will publish approved attribute group  
4668 registration specifications as separate files:

4669 ftp.isi.edu/iana/assignments/ipp/attribute-group-tags/xxx-yyy-tag.txt

4670 where 'xxx-yyy-tag' is the new attribute group tag name.

## 4671 6.6 Status Code Extensibility

4672 Operation status codes may also be registered following the type2 procedures described in Section 6.1. The  
4673 values for status codes are allocated in ranges as specified in Section 14 for each status code class:

4674 "informational" - Request received, continuing process

4675 "successful" - The action was successfully received, understood, and accepted

4676 "redirection" - Further action must be taken in order to complete the request

4677 "client-error" - The request contains bad syntax or cannot be fulfilled

4678 "server-error" - The IPP object failed to fulfill an apparently valid request

4679

4680 For private (unregistered) operation status code extensions, implementers MUST use the top of each range  
4681 as specified in Section 13.

4682 For operation status codes, the IPP Designated Expert in consultation with IANA assigns the next status  
4683 code in the appropriate class range as specified in Section 13. IANA will publish approved status code  
4684 registration specifications as separate files:

4685 ftp.isi.edu/iana/assignments/ipp/status-codes/xxx-yyy.txt

4686 where "xxx-yyy" is the new operation status code keyword.

## 4687 6.7 Registration of MIME types/sub-types for document-formats

4688 The "document-format" attribute's syntax is 'mimeMediaType'. This means that valid values are Internet  
4689 Media Types (see Section 4.1.9). RFC 2045 [RFC2045] defines the syntax for valid Internet media types.  
4690 IANA is the registry for all Internet media types.

## 4691 6.8 Registration of charsets for use in 'charset' attribute values

4692 The "attributes-charset" attribute's syntax is 'charset'. This means that valid values are charsets names.  
4693 When a charset in the IANA registry has more than one name (alias), the name labeled as "(preferred  
4694 MIME name)", if present, MUST be used (see Section 4.1.7). IANA is the registry for charsets following  
4695 the procedures of [RFC2278].

4696 7. Internationalization Considerations

4697 Some of the attributes have values that are text strings and names which are intended for human  
4698 understanding rather than machine understanding (see the 'text' and 'name' attribute syntaxes in Sections  
4699 4.1.1 and 4.1.2).

4700 In each operation request, the client

- 4701 - identifies the charset and natural language of the request which affects each supplied 'text' and 'name'
  - 4702 attribute value, and
  - 4703 - requests the charset and natural language for attributes returned by the IPP object in operation
  - 4704 responses (as described in Section 3.1.4.1).
- 4705

4706 In addition, the client MAY separately and individually identify the Natural Language Override of a  
4707 supplied 'text' or 'name' attribute using the 'textWithLanguage' and 'nameWithLanguage' technique  
4708 described section 4.1.1.2 and 4.1.2.2 respectively.

4709 All IPP objects MUST support the UTF-8 [\[RFC2044\]](#)[\[RFC2279\]](#) charset in all 'text' and 'name' attributes  
4710 supported. If an IPP object supports more than the UTF-8 charset, the object MUST convert between them  
4711 in order to return the requested charset to the client according to Section 3.1.4.2. If an IPP object supports  
4712 more than one natural language, the object SHOULD return 'text' and 'name' values in the natural language  
4713 requested where those values are generated by the Printer (see Section 3.1.4.1).

4714 For Printers that support multiple charsets and/or multiple natural languages in 'text' and 'name' attributes,  
4715 different jobs may have been submitted in differing charsets and/or natural languages. All responses MUST  
4716 be returned in the charset requested by the client. However, the Get-Jobs operation uses the  
4717 'textWithLanguage' and 'nameWithLanguage' mechanism to identify the differing natural languages with  
4718 each job attribute returned.

4719 The Printer object also has configured charset and natural language attributes. The client can query the  
4720 Printer object to determine the list of charsets and natural languages supported by the Printer object and  
4721 what the Printer object's configured values are. See the "charset-configured", "charset-supported", "natural-  
4722 language-configured", and "generated-natural-language-supported" Printer description attributes for more  
4723 details.

4724 The "charset-supported" attributed identifies the supported charsets. If a charset is supported, the IPP  
4725 object MUST be capable of converting to and from that charset into any other supported charset. In many  
4726 cases, an IPP object will support only one charset and it MUST be the UTF-8 charset.

4727 The "charset-configured" attribute identifies the one supported charset which is the native charset given the  
4728 current configuration of the IPP object (administrator defined).

4729 The "generated-natural-language-supported" attribute identifies the set of supported natural languages for  
4730 generated messages; it is not related to the set of natural languages that must be accepted for client supplied  
4731 'text' and 'name' attributes. For client supplied 'text' and 'name' attributes, an IPP object MUST accept ALL  
4732 supplied natural languages. Just because a Printer object is currently configured to support 'en-us' natural

4733 language does not mean that the Printer object should reject a job if the client supplies a job name that is in  
4734 'fr-ca'.

4735 The "natural-language-configured" attribute identifies the one supported natural language for generated  
4736 messages which is the native natural language given the current configuration of the IPP object  
4737 (administrator defined).

4738 Attributes of type 'text' and 'name' are populated from different sources. These attributes can be categorized  
4739 into following groups (depending on the source of the attribute):

- 4740 1. Some attributes are supplied by the client (e.g., the client supplied "job-name", "document-name",  
4741 and "requesting-user-name" operation attributes along with the corresponding Job object's "job-  
4742 name" and "job-originating-user-name" attributes). The IPP object MUST accept these attributes in  
4743 any natural language no matter what the set of supported languages for generated messages
- 4744 2. Some attributes are supplied by the system administrator (e.g., the Printer object's "printer-name" and  
4745 "printer-location" attributes). These too can be in any natural language. If the natural language for  
4746 these attributes is different than what a client requests, then they must be reported using the Natural  
4747 Language Override mechanism.
- 4748 3. Some attributes are supplied by the device manufacturer (e.g., the Printer object's "printer-make-and-  
4749 model" attribute). These too can be in any natural language. If the natural language for these  
4750 attributes is different than what a client requests, then they must be reported using the Natural  
4751 Language Override mechanism.
- 4752 4. Some attributes are supplied by the operator (e.g., the Job object's "job-message-from-operator"  
4753 attribute). These too can be in any natural language. If the natural language for these attributes is  
4754 different than what a client requests, then they must be reported using the Natural Language  
4755 Override mechanism.
- 4756 5. Some attributes are generated by the IPP object (e.g., the Job object's "job-state-message" attribute,  
4757 the Printer object's "printer-state-message" attribute, and the "status-message" operation attribute).  
4758 These attributes can only be in one of the "generated-natural-language-supported" natural  
4759 languages. If a client requests some natural language for these attributes other than one of the  
4760 supported values, the IPP object SHOULD respond using the value of the "natural-language-  
4761 configured" attribute (using the Natural Language Override mechanism if needed).

4763 The 'text' and 'name' attributes specified in this version of this document (additional ones will be registered  
4764 according to the procedures in Section 1.1) are:

<u>Attributes</u>	<u>Source</u>

<u>job-document-access-errors (1setOf text)</u>	<u>Job or Printer object - see rule 1</u>

Printer Description Attributes:

<u>printer-name (name(127))</u>	<u>administrator</u>
<u>printer-location (text(127))</u>	<u>administrator</u>
<u>printer-info (text(127))</u>	<u>administrator</u>
<u>printer-make-and-model (text(127))</u>	<u>administrator or manufacturer</u>
<u>printer-state-message (text)</u>	<u>Printer object</u>
<u>printer-message-from-operator (text(127))</u>	<u>operator</u>

4799 Rule 1 - Neither the Printer nor the client localizes these message attributes, since they are intended for use  
4800 by the system administrator or other experienced technical persons.

4802 8. Security Considerations

4803 ~~Some IPP objects MAY be deployed over protocol stacks that support Secure Socket Layer Version 3~~  
4804 ~~(SSL3) [SSL]. Note: SSL3 is not an IETF standards track specification. Other IPP objects MAY be~~  
4805 ~~deployed over protocol stacks that do not support SSL3. Some IPP objects MAY be deployed over both~~  
4806 ~~types of protocol stacks. Those IPP objects that support SSL3, are capable of supporting mutual~~  
4807 ~~authentication as well as privacy of messages via multiple encryption schemes. An important point about~~  
4808 ~~security related information for SSL3 access to an IPP object, is that the security-related parameters~~  
4809 ~~(authentication, encryption keys, etc.) are "out-of-band" to the actual IPP protocol.~~

4810 ~~An IPP object that does not support SSL3 MAY elect to support a transport layer that provides other~~  
4811 ~~security mechanisms. For example, in a mapping of IPP over HTTP/1.1 [IPP-PRO], if the IPP object does~~  
4812 ~~not support SSL3, HTTP still allows for client authentication using Digest Access Authentication (DAA)~~  
4813 ~~[RFC2069].~~

4814 It is difficult to anticipate the security risks that might exist in any given IPP environment. For example, if  
4815 IPP is used within a given corporation over a private network, the risks of exposing document data may be  
4816 low enough that the corporation will choose not to use encryption on that data. However, if the connection  
4817 between the client and the IPP object is over a public network, the client may wish to protect the content of  
4818 the information during transmission through the network with encryption.

4819 Furthermore, the value of the information being printed may vary from one IPP environment to the next.  
4820 Printing payroll checks, for example, would have a different value than printing public information from a  
4821 file. There is also the possibility of denial-of-service attacks, but denial-of-service attacks against printing  
4822 resources are not well understood and there is no published precedents regarding this scenario.

4823 Once the authenticated identity of the requester has been supplied to the IPP object, the object uses that  
4824 identity to enforce any authorization policy that might be in place. For example, one site's policy might be  
4825 that only the job owner is allowed to cancel a job. The details and mechanisms to set up a particular access  
4826 control policy are not part of IPP/1.0, IPP/1.1, and must be established via some other type of administrative  
4827 or access control framework. However, there are operation status codes that allow an IPP server to return  
4828 information back to a client about any potential access control violations for an IPP object.

4829 During a create operation, the client's identity is recorded in the Job object in an implementation-defined  
4830 attribute. This information can be used to verify a client's identity for subsequent operations on that Job  
4831 object in order to enforce any access control policy that might be in effect. See section 1.1 below for more  
4832 details.

4833 Since the security levels or the specific threats that any given IPP system administrator may be concerned  
4834 with cannot be anticipated, IPP MUST be capable of operating with different security mechanisms and  
4835 security policies as required by the individual installation. Security policies might vary from very strong, to  
4836 very weak, to none at all, and corresponding security mechanisms will be required. ~~SSL3 supports the type  
4837 of negotiated levels of security required by most, if not all, potential IPP environments. IPP environments  
4838 that require no security can elect to deploy IPP objects that do not utilize the optional SSL3 security  
4839 mechanisms.~~

## 4840 8.1 Security Scenarios

4841 The following sections describe specific security attacks for IPP environments. Where examples are  
4842 provided they should be considered illustrative of the environment and not an exhaustive set. Not all of  
4843 these environments will necessarily be addressed in initial implementations of IPP.

### 4844 8.1.1 Client and Server in the Same Security Domain

4845 This environment is typical of internal networks where traditional office workers print the output of  
4846 personal productivity applications on shared work-group printers, or where batch applications print their  
4847 output on large production printers. Although the identity of the user may be trusted in this environment, a  
4848 user might want to protect the content of a document against such attacks as eavesdropping, replaying or  
4849 tampering.

### 4850 8.1.2 Client and Server in Different Security Domains

4851 Examples of this environment include printing a document created by the client on a publicly available  
4852 printer, such as at a commercial print shop; or printing a document remotely on a business associate's  
4853 printer. This latter operation is functionally equivalent to sending the document to the business associate as  
4854 a facsimile. Printing sensitive information on a Printer in a different security domain requires strong  
4855 security measures. In this environment authentication of the printer is required as well as protection against  
4856 unauthorized use of print resources. Since the document crosses security domains, protection against  
4857 eavesdropping and document tampering are also required. It will also be important in this environment to  
4858 protect Printers against "spamming" and malicious document content.

### 4859 8.1.3 Print by Reference

4860 When the document is not stored on the client, printing can be done by reference. That is, the print request  
4861 can contain a reference, or pointer, to the document instead of the actual document itself ([see sections 3.2.2  
4862 and 3.3.2](#)). Standard methods currently do not exist for remote entities to "assume" the credentials of a  
4863 client for forwarding requests to a 3rd party. It is anticipated that Print-By-Reference will be used to access  
4864 "public" documents and that sophisticated methods for authenticating "proxies" ~~will not be specified for  
4865 version 1 of IPP.~~ [is not specified in this document.](#)

8.2 URIs ~~for SSL3 and non-SSL3 Access~~ in Operation, Job, and Printer attributes

~~As described earlier, an IPP object can support SSL3 access, non-SSL3 access, or both.~~ The "printer-uri-supported" attribute contains the Printer object's URI(s). Its companion attribute, "uri-security-supported", identifies the security mechanism used for each URI listed in the "printer-uri-supported" attribute. For each Printer operation request, a client MUST supply only one URI in the "printer-uri" operation attribute. In other words, even though the Printer supports more than one URI, the client only interacts with the Printer object using one of its URIs. This duality is not needed for Job objects, since the Printer object is the factory for Job objects, and the Printer object will generate the correct URI for new Job objects depending on the Printer object's security configuration.

~~8.3 The "requesting-user-name" (name(MAX)) Operation Attribute~~

~~Each operation MUST specify the user who is performing the operation in both of the following two ways:~~

- ~~1) via the REQUIRED "requesting-user-name" operation attribute that a client SHOULD supply in all operations. The client MUST obtain the value for this attribute from an environmental or network login name for the user, rather than allowing the user to supply any value. If the client does not supply a value for "requesting-user-name", the printer MUST assume that the client is supplying some anonymous name, such as "anonymous".~~
- ~~2) via an authentication mechanism of the underlying transport which may be configured to give no authentication information.~~

~~There are six cases to consider:~~

- ~~a) the authentication mechanism gives no information, and the client doesn't specify "requesting-user-name".~~
- ~~b) the authentication mechanism gives no information, but the client specifies "requesting-user-name".~~
- ~~c) the authentication mechanism specifies a user which has no human readable representation, and the client doesn't specify "requesting-user-name".~~
- ~~d) the authentication mechanism specifies a user which has no human readable representation, but the client specifies "requesting-user-name".~~
- ~~e) the authentication mechanism specifies a user which has a human readable representation. The Printer object ignores the "requesting-user-name".~~
- ~~f) the authentication mechanism specifies a user who is trusted and whose name means that the value of the "requesting-user-name", which MUST be present, is treated as the authenticated name.~~

~~Note: Case "f" is intended for a tightly coupled gateway and server to work together so that the "user" name is able to be that of the gateway client and not that of the gateway. Because most, if not all, system vendors will initially implement IPP via a gateway into their existing print system, this mechanism is necessary unless the authentication mechanism allows a gateway (client) to act on behalf of some other client.~~

~~The user name has two forms:~~

- ~~—one that is human readable: it is held in the REQUIRED "job-originating-user-name" Job Description attribute which is set during the job creation operations. It is used for presentation only, such as returning in queries or printing on start sheets~~
- ~~—one for authorization: it is held in an undefined (by IPP) Job object attribute which is set by the job creation operation. It is used to authorize other operations, such as Send Document, Send URI, Cancel Job, to determine the user when the "my-jobs" attribute is specified with Get Jobs, and to limit what attributes and values to return with Get Job Attributes and Get Jobs.~~

~~The human readable user name:~~

- ~~—is the value of the "requesting-user-name" for cases b, d and f.~~
- ~~—comes from the authentication mechanism for case e~~
- ~~—is some anonymous name, such as "anonymous" for cases a and c.~~

~~The user name used for authorization:~~

- ~~—is the value of the "requesting-user-name" for cases b and f.~~
- ~~—comes from the authentication mechanism for cases c, d and e~~
- ~~—is some anonymous name, such as "anonymous" for case a.~~

~~The essence of these rules for resolving conflicting sources of user names is that a printer implementation is free to pick either source as long as it achieves consistent results. That is, if a user uses the same path for a series of requests, the requests MUST appear to come from the same user from the standpoint of both the human readable user name and the user name for authorization. This rule MUST continue to apply even if a request could be authenticated by two or more mechanisms. It doesn't matter which of several authentication mechanisms a Printer uses as long as it achieves consistent results. If a client uses more than one authentication mechanism, it is recommended that an administrator make all credentials resolve to the same user and user name as much as possible.~~

### 8.3 URIs for each authentication mechanisms

Each URI has an authentication mechanism associated with it. If the URI is the i'th element of "printer-uri-supported", then authentication mechanism is the "i th" element of "uri-authentication-supported". For a list of possible authentication mechanisms, see section 4.4.2.

The Printer object uses an authentication mechanism to determine the name of the user performing an operation. This user is called the "authenticated user". The credibility of authentication depends on the mechanism that the Printer uses to obtain the user's name. When the authentication mechanism is 'none', all authenticated users are "anonymous".

During job creation operations, the Printer initializes the value of the "job-originating-user-name" attribute (see section 4.3.6) to be the authenticated user. The authenticated user in this case is called the "job-owner".

If an implementation can be configured to support more than one authentication mechanism, then it MUST implement rules for determining equality of authenticated user names which have been authenticated via

4942 different authentication mechanisms. One possible policy is that identical names that are authenticated via  
4943 different mechanism are different. For example, a user can cancel his job only if he uses the same  
4944 authentication mechanism for both Cancel-Job and Print-Job. Another policy is that identical names that  
4945 are authenticated via different mechanism are the same if the authentication mechanism for the later  
4946 operation is not less strong than the authentication mechanism for the earlier job creation operation. For  
4947 example, a user can cancel his job only if he uses the same or stronger authentication mechanism for  
4948 Cancel-Job and Print-Job. With this second policy a job submitted via 'requesting-user-name' authentication  
4949 could be cancelled via 'digest' authentication. With the first policy, the job could not be cancelled in this  
4950 way.

4951 A client is able to determine the authentication mechanism used to create a job. It is the i'th value of the  
4952 Printer's "uri-authentication-supported" attribute (see section 4.4.2), where i is the index of the element of  
4953 the Printer's "printer-uri-supported" attribute (see section 4.4.1) equal to the job's "job-printer-uri" attribute  
4954 (see section 4.3.3).

#### 4955 8.4 Restricted Queries

4956 In many IPP operations, a client supplies a list of attributes to be returned in the response. For security  
4957 reasons, an IPP object may be configured not to return all attributes (or all values) that a client requests.  
4958 The job attributes returned MAY depend on whether the requesting user is the same as the user that  
4959 submitted the job. The IPP object MAY even return none of the requested attributes. In such cases, the  
4960 status returned is the same as if the object had returned all requested attributes. The client cannot tell by  
4961 such a response whether the requested attribute was present or absent on the object.

#### 4962 8.5 Operations performed by operators and system administrators

4963 For the three printer operations Pause-Printer, Resume-Printer, and Purge-Jobs (see sections 3.2.7, 3.2.8 and  
4964 3.2.9), the requesting user is intended to be an operator or administrator of the Printer object (see section 1).  
4965 For operations on jobs, the requesting user is intended to be the job owner or may be an operator or  
4966 administrator of the Printer object. The means for authorizing an operator or administrator of the Printer  
4967 object are not specified in this document.

#### 4968 8.6 Queries on jobs submitted using non-IPP protocols

4969 If the device that an IPP Printer is representing is able to accept jobs using other job submission protocols  
4970 in addition to IPP, it is RECOMMENDED that such an implementation at least allow such "foreign" jobs to  
4971 be queried using Get-Jobs returning "job-id" and "job-uri" as 'unknown'. Such an implementation NEED  
4972 NOT support all of the same IPP job attributes as for IPP jobs. The IPP object returns the 'unknown' out-of-  
4973 band value for any requested attribute of a foreign job that is supported for IPP jobs, but not for foreign  
4974 jobs.

4975 It is further RECOMMENDED, that the IPP Printer generate "job-id" and "job-uri" values for such "foreign  
4976 jobs", if possible, so that they may be targets of other IPP operations, such as Get-Job-Attributes and  
4977 Cancel-Job. Such an implementation also needs to deal with the problem of authentication of such foreign

4978 jobs. One approach would be to treat all such foreign jobs as belonging to users other than the user of the  
4979 IPP client. Another approach would be for the foreign job to belong to 'anonymous'. Only if the IPP client  
4980 has been authenticated as an operator or administrator of the IPP Printer object, could the foreign jobs be  
4981 queried by an IPP request. Alternatively, if the security policy is to allow users to query other users' jobs,  
4982 then the foreign jobs would also be visible to an end-user IPP client using Get-Jobs and Get-Job-Attributes.

### 4983 ~~8.6~~IPP Security Application Profile for SSL3

4984 ~~The IPP application profile for SSL3 follows the "Secure Socket Layer" requirement as documented in the~~  
4985 ~~SSL3 specification [SSL]. For interoperability, the SSL3 cipher suites are:~~

4986 ~~SSL\_RSA\_WITH\_RC4\_128\_MD5~~  
4987 ~~SSL\_RSA\_WITH\_3DES\_EDE\_CBC\_SHA~~  
4988 ~~SSL\_RSA\_WITH\_DES\_CBC\_SHA~~  
4989 ~~SSL\_RSA\_EXPORT\_WITH\_RC4\_40\_MD5~~  
4990 ~~SSL\_RSA\_EXPORT\_WITH\_RC2\_CBC\_40\_MD5~~  
4991 ~~SSL\_RSA\_WITH\_NULL\_MD5~~

4992 ~~Client implementations MUST NOT assume any other cipher suites are supported by an IPP Printer object.~~

4993 ~~If a conforming IPP object supports SSL3, it MUST implement and support the cipher suites listed above~~  
4994 ~~and MAY support additional cipher suites.~~

4995 ~~A conforming IPP client SHOULD support SSL3 including the cipher suites listed above. A conforming~~  
4996 ~~IPP client MAY support additional cipher suites.~~

4997 ~~It is possible that due to certain government export restrictions some non-compliant versions of this~~  
4998 ~~extension could be deployed. Implementations wishing to inter-operate with such non-compliant versions~~  
4999 ~~MAY offer the SSL\_RSA\_EXPORT\_WITH\_RC4\_40\_MD5 and~~  
5000 ~~SSL\_RSA\_EXPORT\_WITH\_RC2\_CBC\_40\_MD5 mechanisms. However, since 40 bit ciphers are known~~  
5001 ~~to be vulnerable to attack by current technology, any client which activates a 40 bit cipher MUST NOT~~  
5002 ~~indicate to the user that the connection is completely secure from eavesdropping.~~

## 5275 11. Formats for IPP Registration Proposals

5276 In order to propose an IPP extension for registration, the proposer must submit an application to IANA by  
5277 email to "iana@iana.org" or by filling out the appropriate form on the IANA web pages  
5278 (http://www.iana.org). This section specifies the required information and the formats for proposing  
5279 registrations of extensions to IPP as provided in Section 6 for:

5280

5281 1. type2 'keyword' attribute values

5282 2. type3 'keyword' attribute values

5283 3. type2 'enum' attribute values

5284 4. type3 'enum' attribute values

5285 5. attributes

5286 6. attribute syntaxes

5287 7. operations

5288 8. status codes

## 5289 11.1 Type2 keyword attribute values registration

5290 Type of registration: type2 keyword attribute value

5291 Name of attribute to which this keyword specification is to be added:

5292 Proposed keyword name of this keyword value:

5293 Specification of this keyword value (follow the style of IPP Model Section 4.1.2.3):

5294 Name of proposer:

5295 Address of proposer:

5296 Email address of proposer:

5297

5298 Note: For type2 keywords, the Designated Expert will be the point of contact for the approved registration  
5299 specification, if any maintenance of the registration specification is needed.

## 5300 11.2 Type3 keyword attribute values registration

5301 Type of registration: type3 keyword attribute value

5302 Name of attribute to which this keyword specification is to be added:

5303 Proposed keyword name of this keyword value:

5304 Specification of this keyword value (follow the style of IPP Model Section 4.1.2.3):

5305 Name of proposer:

5306 Address of proposer:

5307 Email address of proposer:

5308

5309 Note: For type3 keywords, the proposer will be the point of contact for the approved registration  
5310 specification, if any maintenance of the registration specification is needed.

## 5311 11.3 Type2 enum attribute values registration

5312 Type of registration: type2 enum attribute value

5313 Name of attribute to which this enum specification is to be added:

- 5314 Keyword symbolic name of this enum value:  
5315 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):  
5316 Specification of this enum value (follow the style of IPP Model Section 4.1.4):  
5317 Name of proposer:  
5318 Address of proposer:  
5319 Email address of proposer:  
5320  
5321 Note: For type2 enums, the Designated Expert will be the point of contact for the approved registration  
5322 specification, if any maintenance of the registration specification is needed.
- 5323 11.4 Type3 enum attribute values registration
- 5324 Type of registration: type3 enum attribute value  
5325 Name of attribute to which this enum specification is to be added:  
5326 Keyword symbolic name of this enum value:  
5327 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):  
5328 Specification of this enum value (follow the style of IPP Model Section 4.1.4):  
5329 Name of proposer:  
5330 Address of proposer:  
5331 Email address of proposer:  
5332  
5333 Note: For type3 enums, the proposer will be the point of contact for the approved registration specification,  
5334 if any maintenance of the registration specification is needed.
- 5335 11.5 Attribute registration
- 5336 Type of registration: attribute  
5337 Proposed keyword name of this attribute:  
5338 Types of attribute (Operation, Job Template, Job Description, Printer Description):  
5339 Operations to be used with if the attribute is an operation attribute:  
5340 Object (Job, Printer, etc. if bound to an object):  
5341 Attribute syntax(es) (include 1setOf and range as in Section 4.2):  
5342 If attribute syntax is 'keyword' or 'enum', is it type2 or type3:  
5343 If this is a Printer attribute, MAY the value returned depend on "document-format" (See Section 6.2):  
5344 If this is a Job Template attribute, how does its specification depend on the value of the "multiple-  
5345 document-handling" attribute:  
5346 Specification of this attribute (follow the style of IPP Model Section 4.2):  
5347 Name of proposer:  
5348 Address of proposer:  
5349 Email address of proposer:  
5350  
5351 Note: For attributes, the IPP Designated Expert will be the point of contact for the approved registration  
5352 specification, if any maintenance of the registration specification is needed.

5353 11.6 Attribute Syntax registration

5354 Type of registration: attribute syntax

5355 Proposed name of this attribute syntax:

5356 Type of attribute syntax (integer, octetString, character-string, see [IPP-PRO]):

5357 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):

5358 Specification of this attribute (follow the style of IPP Model Section 4.1):

5359 Name of proposer:

5360 Address of proposer:

5361 Email address of proposer:

5362

5363 Note: For attribute syntaxes, the IPP Designated Expert will be the point of contact for the approved  
5364 registration specification, if any maintenance of the registration specification is needed.

5365 11.7 Operation registration

5366 Type of registration: operation

5367 Proposed name of this operation:

5368 Numeric operation-id value (to be assigned by the IPP Designated Expert in consultation with IANA):

5369 Object Target (Job, Printer, etc. that operation is upon):

5370 Specification of this ~~attribute~~operation (follow the style of IPP Model Section 3):

5371 Name of proposer:

5372 Address of proposer:

5373 Email address of proposer:

5374

5375 Note: For operations, the IPP Designated Expert will be the point of contact for the approved registration  
5376 specification, if any maintenance of the registration specification is needed.

5377 11.8 Attribute Group registration

5378 Type of registration: attribute group

5379 Proposed name of this attribute group:

5380 Numeric tag according to [IPP-PRO] (to be assigned by the IPP Designated Expert in consultation with  
5381 IANA):

5382 Operation requests and group number for each operation in which the attribute group occurs:

5383 Operation responses and group number for each operation in which the attribute group occurs:

5384 Specification of this attribute group (follow the style of IPP Model Section 3):

5385 Name of proposer:

5386 Address of proposer:

5387 Email address of proposer:

5388

5389 Note: For attribute groups, the IPP Designated Expert will be the point of contact for the approved  
5390 registration specification, if any maintenance of the registration specification is needed.

5391 11.9 Status code registration

5392 Type of registration: status code

5393 Keyword symbolic name of this status code value:

5394 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):

5395 Operations that this status code may be used with:

5396 Specification of this status code (follow the style of IPP Model Section 13 APPENDIX B: Status Codes  
5397 and Suggested Status Code Messages):

5398 Name of proposer:

5399 Address of proposer:

5400 Email address of proposer:

5401

5402 Note: For status codes, the Designated Expert will be the point of contact for the approved registration  
5403 specification, if any maintenance of the registration specification is needed.

5404 12. APPENDIX A: Terminology

5405 This specification document uses the terminology defined in this section.

5406 12.1 Conformance Terminology

5407 The key words "MUST", "MUST NOT", "REQUIRED", "SHOULD", "SHOULD NOT",

5408 "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in  
5409 RFC 2119 [RFC2119].

5410 12.1.1 NEED NOT

5411 This term is not included in RFC 2119. The verb "NEED NOT" indicates an action that the subject of the  
5412 sentence does not have to implement in order to claim conformance to the standard. The verb "NEED  
5413 NOT" is used instead of "MAY NOT" since "MAY NOT" sounds like a prohibition.

5414 12.2 Model Terminology

5415 12.2.1 Keyword

5416 Keywords are used within this document as identifiers of semantic entities within the abstract model (see  
5417 section 4.1.2.3). Attribute names, some attribute values, attribute syntaxes, and attribute group names are  
5418 represented as keywords.

5419 12.2.2 Attributes

5420 An attribute is an item of information that is associated with an instance of an IPP object. An attribute  
5421 consists of an attribute name and one or more attribute values. Each attribute has a specific attribute syntax.  
5422 All object attributes are defined in section 4 and all operation attributes are defined in section 3.

5423 Job Template Attributes are described in section 4.2. The client optionally supplies Job Template attributes  
5424 in a create request (operation requests that create Job objects). The Printer object has associated attributes  
5425 which define supported and default values for the Printer.

5426 12.2.2.1 Attribute Name

5427 Each attribute is uniquely identified in this document by its attribute name. An attribute name is a keyword.  
5428 The keyword attribute name is given in the section header describing that attribute. In running text in this  
5429 document, attribute names are indicated inside double quotation marks (") where the quotation marks are  
5430 not part of the keyword itself.

5431 12.2.2.2 Attribute Group Name

5432 Related attributes are grouped into named groups. The name of the group is a keyword. The group name  
5433 may be used in place of naming all the attributes in the group explicitly. Attribute groups are defined in  
5434 section 3.

5435 12.2.2.3 Attribute Value

5436 Each attribute has one or more values. Attribute values are represented in the syntax type specified for that  
5437 attribute. In running text in this document, attribute values are indicated inside single quotation marks ('),  
5438 whether their attribute syntax is keyword, integer, text, etc. where the quotation marks are not part of the  
5439 value itself.

5440 12.2.2.4 Attribute Syntax

5441 Each attribute is defined using an explicit syntax type. In this document, each syntax type is defined as a  
5442 keyword with specific meaning. The ~~Encoding and Transport~~ "Encoding and Transport" document [IPP-  
5443 PRO] indicates the actual "on-the-wire" encoding rules for each syntax type. Attribute syntax types are  
5444 defined in section 4.1.

5445 12.2.3 Supports

5446 By definition, a Printer object supports an attribute only if that Printer object responds with the  
5447 corresponding attribute populated with some value(s) in a response to a query for that attribute. A Printer  
5448 object supports an attribute value if the value is one of the Printer object's "supported values" attributes.  
5449 The device behind a Printer object may exhibit a behavior that corresponds to some IPP attribute, but if the  
5450 Printer object, when queried for that attribute, doesn't respond with the attribute, then as far as IPP is  
5451 concerned, that implementation does not support that feature. If the Printer object's "xxx-supported"

5452 attribute is not populated with a particular value (even if that value is a legal value for that attribute), then  
5453 that Printer object does not support that particular value.

5454 A conforming implementation MUST support all REQUIRED attributes. However, even for REQUIRED  
5455 attributes, conformance to IPP does not mandate that all implementations support all possible values  
5456 representing all possible job processing behaviors and features. For example, if a given instance of a  
5457 Printer supports only certain document formats, then that Printer responds with the "document-format-  
5458 supported" attribute populated with a set of values, possibly only one, taken from the entire set of possible  
5459 values defined for that attribute. This limited set of values represents the Printer's set of supported  
5460 document formats. Supporting an attribute and some set of values for that attribute enables IPP end users to  
5461 be aware of and make use of those features associated with that attribute and those values. If an  
5462 implementation chooses to not support an attribute or some specific value, then IPP end users would have  
5463 no ability to make use of that feature within the context of IPP itself. However, due to existing practice and  
5464 legacy systems which are not IPP aware, there might be some other mechanism outside the scope of IPP to  
5465 control or request the "unsupported" feature (such as embedded instructions within the document data  
5466 itself).

5467 For example, consider the "finishings-supported" attribute.

- 5468 1) If a Printer object is not physically capable of stapling, the "finishings-supported" attribute MUST  
5469 NOT be populated with the value of 'staple'.
- 5470 2) A Printer object is physically capable of stapling, however an implementation chooses not to support  
5471 stapling in the IPP "finishings" attribute. In this case, 'staple' MUST NOT be a value in the  
5472 "finishings-supported" Printer object attribute. Without support for the value 'staple', an IPP end  
5473 user would have no means within the protocol itself to request that a Job be stapled. However, an  
5474 existing document data formatter might be able to request that the document be stapled directly with  
5475 an embedded instruction within the document data. In this case, the IPP implementation does not  
5476 "support" stapling, however the end user is still able to have some control over the stapling of the  
5477 completed job.
- 5478 3) A Printer object is physically capable of stapling, and an implementation chooses to support stapling  
5479 in the IPP "finishings" attribute. In this case, 'staple' MUST be a value in the "finishings-supported"  
5480 Printer object attribute. Doing so, would enable end users to be aware of and make use of the  
5481 stapling feature using IPP attributes.

5482  
5483 Even though support for Job Template attributes by a Printer object is OPTIONAL, it is RECOMMENDED  
5484 that if the device behind a Printer object is capable of realizing any feature or function that corresponds to  
5485 an IPP attribute and some associated value, then that implementation SHOULD support that IPP attribute  
5486 and value.

5487 The set of values in any of the supported value attributes is set (populated) by some administrative process  
5488 or automatic sensing mechanism that is outside the scope of [IPP-this IPP/1.1 document](#). For administrative  
5489 policy and control reasons, an administrator may choose to make only a subset of possible values visible to  
5490 the end user. In this case, the real output device behind the IPP Printer abstraction may be capable of a  
5491 certain feature, however an administrator is specifying that access to that feature not be exposed to the end  
5492 user through the IPP protocol. Also, since a Printer object may represent a logical print device (not just a

5493 physical device) the actual process for supporting a value is undefined and left up to the implementation.  
5494 However, if a Printer object supports a value, some manual human action may be needed to realize the  
5495 semantic action associated with the value, but no end user action is required.

5496 For example, if one of the values in the "finishings-supported" attribute is 'staple', the actual process might  
5497 be an automatic staple action by a physical device controlled by some command sent to the device. Or, the  
5498 actual process of stapling might be a manual action by an operator at an operator attended Printer object.

5499 For another example of how supported attributes function, consider a system administrator who desires to  
5500 control all print jobs so that no job sheets are printed in order to conserve paper. To force no job sheets, the  
5501 system administrator sets the only supported value for the "job-sheets-supported" attribute to 'none'. In this  
5502 case, if a client requests anything except 'none', the create request is rejected or the "job-sheets" value is  
5503 ignored (depending on the value of "ipp-attribute-fidelity"). To force the use of job start/end sheets on all  
5504 jobs, the administrator does not include the value 'none' in the "job-sheets-supported" attribute. In this case,  
5505 if a client requests 'none', the create request is rejected or the "job-sheets" value is ignored (again depending  
5506 on the value of "ipp-attribute-fidelity").

#### 5507 12.2.4 print-stream page

5508 A "print-stream page" is a page according to the definition of pages in the language used to express the  
5509 document data.

#### 5510 12.2.5 impression

5511 An "impression" is the image (possibly many print-stream pages in different configurations) imposed onto a  
5512 single media page.

### 5513 13. APPENDIX B: Status Codes and Suggested Status Code Messages

5514 This section defines status code enum keywords and values that are used to provide semantic information  
5515 on the results of an operation request. Each operation response MUST include a status code. The response  
5516 MAY also contain a status message that provides a short textual description of the status. The status code  
5517 is intended for use by automata, and the status message is intended for the human end user. Since the status  
5518 message is an OPTIONAL component of the operation response, an IPP application (i.e., a browser, GUI,  
5519 print driver or gateway) is NOT REQUIRED to examine or display the status message, since it MAY not be  
5520 returned to the application.

5521 The prefix of the status keyword defines the class of response as follows:

- 5522 "informational" - Request received, continuing process
- 5523 "successful" - The action was successfully received, understood, and accepted
- 5524 "redirection" - Further action must be taken in order to complete the request
- 5525 "client-error" - The request contains bad syntax or cannot be fulfilled
- 5526 "server-error" - The IPP object failed to fulfill an apparently valid request

5527

5528 As with type2 enums, IPP status codes are extensible. IPP clients are NOT REQUIRED to understand the  
5529 meaning of all registered status codes, though such understanding is obviously desirable. However, IPP  
5530 clients MUST understand the class of any status code, as indicated by the prefix, and treat any unrecognized  
5531 response as being equivalent to the first status code of that class, with the exception that an unrecognized  
5532 response MUST NOT be cached. For example, if an unrecognized status code of "client-error-xxx-yyy" is  
5533 received by the client, it can safely assume that there was something wrong with its request and treat the  
5534 response as if it had received a "client-error-bad-request" status code. In such cases, IPP applications  
5535 SHOULD present the OPTIONAL message (if present) to the end user since the message is likely to  
5536 contain human readable information which will help to explain the unusual status. The name of the enum  
5537 is the suggested status message for US English.

5538 The status code values range from 0x0000 to 0x7FFF. The value ranges for each status code class are as  
5539 follows:

5540 "successful" - 0x0000 to 0x00FF  
5541 "informational" - 0x0100 to 0x01FF  
5542 "redirection" - 0x0200 to 0x02FF  
5543 "client-error" - 0x0400 to 0x04FF  
5544 "server-error" - 0x0500 to 0x05FF  
5545

5546 The top half (128 values) of each range (0x0n40 to 0x0nFF, for n = 0 to 5) is reserved for private use within  
5547 each status code class. Values 0x0600 to 0x7FFF are reserved for future assignment and MUST NOT be  
5548 used.

## 5549 13.1 Status Codes

5550 Each status code is described below. Section 13.1.5.9 contains a table that indicates which status codes  
5551 apply to which operations. The Implementer's Guide [IPP-IIG] describe the suggested steps for processing  
5552 IPP attributes for all operations, including returning status codes.

### 5553 13.1.1 Informational

5554 This class of status code indicates a provisional response and is to be used for informational purposes only.

5555 There are no status codes defined in ~~IPP/1.0~~ IPP/1.1 for this class of status code.

### 5556 13.1.2 Successful Status Codes

5557 This class of status code indicates that the client's request was successfully received, understood, and  
5558 accepted.

5559 13.1.2.1 successful-ok (0x0000)

5560 The request has succeeded and no request attributes were substituted or ignored. In the case of a response  
5561 to a create request, the 'successful-ok' status code indicates that the request was successfully received and  
5562 validated, and that the Job object has been created; it does not indicate that the job has been processed. The  
5563 transition of the Job object into the 'completed' state is the only indicator that the job has been printed.

5564 13.1.2.2 successful-ok-ignored-or-substituted-attributes (0x0001)

5565 The request has succeeded, but some supplied (1) attributes were ignored or (2) unsupported values were  
5566 substituted with supported values or were ignored in order to perform the operation without rejecting it.  
5567 Unsupported attributes, attribute syntaxes, or values MUST be returned in the Unsupported Attributes  
5568 group of the response for all operations. There is an exception to this rule for the query operations: Get-  
5569 Printer-Attributes, Get-Jobs, and Get-Job-Attributes for the "requested-attributes" operation attribute only.  
5570 When the supplied values of the "requested-attributes" operation attribute are requesting attributes that are  
5571 not supported, the IPP object MAY, but is NOT REQUIRED to, return the "requested-attributes" attribute  
5572 in the Unsupported Attribute response group (with the unsupported values only). See sections 3.1.7 and  
5573 3.2.1.2.

5574 13.1.2.3 successful-ok-conflicting-attributes (0x0002)

5575 The request has succeeded, but some supplied attribute values conflicted with the values of other supplied  
5576 attributes. These conflicting values were either (1) substituted with (supported) values or (2) the attributes  
5577 were removed in order to process the job without rejecting it. Attributes or values which conflict with other  
5578 attributes and have been substituted or ignored MUST be returned in the Unsupported Attributes group of  
5579 the response for all operations as supplied by the client. See sections 3.1.7 and 3.2.1.2.

5580 13.1.3 Redirection Status Codes

5581 This class of status code indicates that further action needs to be taken to fulfill the request.

5582 There are no status codes defined in ~~IPP/1.0~~ IPP/1.1 for this class of status code.

5583 13.1.4 Client Error Status Codes

5584 This class of status code is intended for cases in which the client seems to have erred. The IPP object  
5585 SHOULD return a message containing an explanation of the error situation and whether it is a temporary or  
5586 permanent condition.

5587 13.1.4.1 client-error-bad-request (0x0400)

5588 The request could not be understood by the IPP object due to malformed syntax (such as the value of a  
5589 fixed length attribute whose length does not match the prescribed length for that attribute - see the  
5590 Implementer's Guide [IPP-IIG]). The IPP application SHOULD NOT repeat the request without  
5591 modifications.

5592 13.1.4.2 client-error-forbidden (0x0401)

5593 The IPP object understood the request, but is refusing to fulfill it. Additional authentication information or  
5594 authorization credentials will not help and the request SHOULD NOT be repeated. This status code is  
5595 commonly used when the IPP object does not wish to reveal exactly why the request has been refused or  
5596 when no other response is applicable.

5597 13.1.4.3 client-error-not-authenticated (0x0402)

5598 The request requires user authentication. The IPP client may repeat the request with suitable authentication  
5599 information. If the request already included authentication information, then this status code indicates that  
5600 authorization has been refused for those credentials. If this response contains the same challenge as the  
5601 prior response, and the user agent has already attempted authentication at least once, then the response  
5602 message may contain relevant diagnostic information. This status codes reveals more information than  
5603 "client-error-forbidden".

5604 13.1.4.4 client-error-not-authorized (0x0403)

5605 The requester is not authorized to perform the request. Additional authentication information or  
5606 authorization credentials will not help and the request SHOULD NOT be repeated. This status code is used  
5607 when the IPP object wishes to reveal that the authentication information is understandable, however, the  
5608 requester is explicitly not authorized to perform the request. This status codes reveals more information  
5609 than "client-error-forbidden" and "client-error-not-authenticated".

5610 13.1.4.5 client-error-not-possible (0x0404)

5611 This status code is used when the request is for something that can not happen. For example, there might  
5612 be a request to cancel a job that has already been canceled or aborted by the system. The IPP client  
5613 SHOULD NOT repeat the request.

5614 13.1.4.6 client-error-timeout (0x0405)

5615 The client did not produce a request within the time that the IPP object was prepared to wait. For example,  
5616 a client issued a Create-Job operation and then, after a long period of time, issued a Send-Document  
5617 operation and this error status code was returned in response to the Send-Document request (see section  
5618 3.3.1). The IPP object might have been forced to clean up resources that had been held for the waiting  
5619 additional Documents. The IPP object was forced to close the Job since the client took too long. The client  
5620 SHOULD NOT repeat the request without modifications.

5621 13.1.4.7 client-error-not-found (0x0406)

5622 The IPP object has not found anything matching the request URI. No indication is given of whether the  
5623 condition is temporary or permanent. For example, a client with an old reference to a Job (a URI) tries to  
5624 cancel the Job, however in the mean time the Job might have been completed and all record of it at the

5625 Printer has been deleted. This status code, 'client-error-not-found' is returned indicating that the referenced  
5626 Job can not be found. This error status code is also used when a client supplies a URI as a reference to the  
5627 document data in either a Print-URI or Send-URI operation, but the document can not be found.

5628 In practice, an IPP application should avoid a not found situation by first querying and presenting a list of  
5629 valid Printer URIs and Job URIs to the end-user.

#### 5630 13.1.4.8 client-error-gone (0x0407)

5631 The requested object is no longer available and no forwarding address is known. This condition should be  
5632 considered permanent. Clients with link editing capabilities should delete references to the request URI  
5633 after user approval. If the IPP object does not know or has no facility to determine, whether or not the  
5634 condition is permanent, the status code "client-error-not-found" should be used instead.

5635 This response is primarily intended to assist the task of maintenance by notifying the recipient that the  
5636 resource is intentionally unavailable and that the IPP object administrator desires that remote links to that  
5637 resource be removed. It is not necessary to mark all permanently unavailable resources as "gone" or to keep  
5638 the mark for any length of time -- that is left to the discretion of the IPP object administrator.

#### 5639 13.1.4.9 client-error-request-entity-too-large (0x0408)

5640 The IPP object is refusing to process a request because the request entity is larger than the IPP object is  
5641 willing or able to process. An IPP Printer returns this status code when it limits the size of print jobs and it  
5642 receives a print job that exceeds that limit or when the attributes are so many that their encoding causes the  
5643 request entity to exceed IPP object capacity.

#### 5644 13.1.4.10 client-error-request-value-too-long (0x0409)

5645 The IPP object is refusing to service the request because one or more of the client-supplied attributes has a  
5646 variable length value that is longer than the maximum length specified for that attribute. The IPP object  
5647 might not have sufficient resources (memory, buffers, etc.) to process (even temporarily), interpret, and/or  
5648 ignore a value larger than the maximum length. Another use of this error code is when the IPP object  
5649 supports the processing of a large value that is less than the maximum length, but during the processing of  
5650 the request as a whole, the object may pass the value onto some other system component which is not able  
5651 to accept the large value. For more details, see the Implementer's Guide [IPP-IIG].

5652 Note: For attribute values that are URIs, this rare condition is only likely to occur when a client has  
5653 improperly submitted a request with long query information (e.g. an IPP application allows an end-user to  
5654 enter an invalid URI), when the client has descended into a URI "black hole" of redirection (e.g., a  
5655 redirected URI prefix that points to a suffix of itself), or when the IPP object is under attack by a client  
5656 attempting to exploit security holes present in some IPP objects using fixed-length buffers for reading or  
5657 manipulating the Request-URI.

## 5658 13.1.4.11 client-error-document-format-not-supported (0x040A)

5659 The IPP object is refusing to service the request because the document data is in a format, as specified in  
5660 the "document-format" operation attribute, that is not supported by the Printer object. This error is returned  
5661 independent of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return this status code,  
5662 even if there are other [Job Template](#) attributes that are not supported as well, since this error is a bigger  
5663 problem than with Job Template attributes. [See sections 3.1.7 and 3.2.1.1.](#)

## 5664 13.1.4.12 client-error-attributes-or-values-not-supported (0x040B)

5665 In a create request, if the Printer object does not support one or more attributes, attribute syntaxes, or  
5666 attribute values supplied in the request and the client supplied the "ipp-attributes-fidelity" operation  
5667 attribute with the 'true' value, the Printer object MUST return this status code. [The Printer object MUST](#)  
5668 [also return in the Unsupported Attributes Group all the attributes and/or values supplied by the client that](#)  
5669 [are not supported.](#) [See section 3.1.7.](#) For example, if the request indicates 'iso-a4' media, but that media  
5670 type is not supported by the Printer object. Or, if the client supplies [an optional a Job Template](#) attribute and  
5671 the attribute itself is not even supported by the Printer. If the "ipp-attribute-fidelity" attribute is 'false', the  
5672 Printer MUST ignore or substitute values for unsupported [Job Template](#) attributes and values rather than  
5673 reject the request and return this status code.

5674 For any operation where a client requests attributes (such as a Get-Jobs, Get-Printer-Attributes, or Get-Job-  
5675 Attributes operation), if the IPP object does not support one or more of the requested attributes, the IPP  
5676 object simply ignores the unsupported requested attributes and processes the request as if they had not been  
5677 supplied, rather than returning this status code. In this case, the IPP object MUST return the 'successful-ok-  
5678 ignored-or-substituted-attributes' status code and MAY return the unsupported attributes as values of the  
5679 "requested-attributes" in the Unsupported Attributes Group (see section 13.1.2.2).

## 5680 13.1.4.13 client-error-uri-scheme-not-supported (0x040C)

5681 The [type of the client supplied scheme of the client-supplied](#) URI in a Print-URI or a Send-URI operation is  
5682 not supported. [See section 3.1.7.](#)

## 5683 13.1.4.14 client-error-charset-not-supported (0x040D)

5684 For any operation, if the IPP Printer does not support the charset supplied by the client in the "attributes-  
5685 charset" operation attribute, the Printer MUST reject the operation and return this status and any 'text' or  
5686 'name' attributes using the 'utf-8' charset (see Section 3.1.4.1). [See section 3.1.7.](#)

## 5687 13.1.4.15 client-error-conflicting-attributes (0x040E)

5688 The request is rejected because some attribute values conflicted with the values of other attributes which  
5689 this [specification document](#) does not permit to be substituted or ignored. [The Printer object MUST also](#)  
5690 [return in the Unsupported Attributes Group the conflicting attributes supplied by the client.](#) [See sections](#)  
5691 [3.1.7 and 3.2.1.2.](#)

5692 13.1.4.16 client-error-compression-not-supported (0x040F)

5693 The IPP object is refusing to service the request because the document data, as specified in the  
5694 "compression" operation attribute, is compressed in a way that is not supported by the Printer object. This  
5695 error is returned independent of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return  
5696 this status code, even if there are other Job Template attributes that are not supported as well, since this  
5697 error is a bigger problem than with Job Template attributes. See sections 3.1.7 and 3.2.1.1.

5698 13.1.4.17 client-error-compression-error (0x0410)

5699 The IPP object is refusing to service the request because the document data cannot be decompressed when  
5700 using the algorithm specified by the "compression" operation attribute. This error is returned independent  
5701 of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return this status code, even if there  
5702 are Job Template attributes that are not supported as well, since this error is a bigger problem than with Job  
5703 Template attributes. See sections 3.1.7 and 3.2.1.1.

5704 13.1.4.18 client-error-document-format-error (0x0411)

5705 The IPP object is refusing to service the request because Printer encountered an error in the document data  
5706 while interpreting it. This error is returned independent of the client-supplied "ipp-attribute-fidelity". The  
5707 Printer object MUST return this status code, even if there are Job Template attributes that are not supported  
5708 as well, since this error is a bigger problem than with Job Template attributes. See sections 3.1.7 and  
5709 3.2.1.1.

5710 13.1.4.19 client-error-document-access-error (0x0412)

5711 The IPP object is refusing to service the Print-URI or Send-URI request because Printer encountered an  
5712 access error while attempting to validate the accessibility or access the document data specified in the  
5713 "document-uri" operation attribute. The Printer MAY also return a specific document access error code  
5714 using the "document-access-error" operation attribute (see section 3.1.6.4). This error is returned  
5715 independent of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return this status code,  
5716 even if there are Job Template attributes that are not supported as well, since this error is a bigger problem  
5717 than with Job Template attributes. See section 3.1.7.

## 5718 13.1.5 Server Error Status Codes

5719 This class of status codes indicates cases in which the IPP object is aware that it has erred or is incapable of  
5720 performing the request. The IPP object SHOULD include a message containing an explanation of the error  
5721 situation, and whether it is a temporary or permanent condition.

## 5722 13.1.5.1 server-error-internal-error (0x0500)

5723 The IPP object encountered an unexpected condition that prevented it from fulfilling the request. This error  
5724 status code differs from "server-error-temporary-error" in that it implies a more permanent type of internal

5725 error. It also differs from "server-error-device-error" in that it implies an unexpected condition (unlike a  
5726 paper-jam or out-of-toner problem which is undesirable but expected). This error status code indicates that  
5727 probably some knowledgeable human intervention is required.

#### 5728 13.1.5.2 server-error-operation-not-supported (0x0501)

5729 The IPP object does not support the functionality required to fulfill the request. This is the appropriate  
5730 response when the IPP object does not recognize an operation or is not capable of supporting it. See section  
5731 3.1.7.

#### 5732 13.1.5.3 server-error-service-unavailable (0x0502)

5733 The IPP object is currently unable to handle the request due to a temporary overloading or maintenance of  
5734 the IPP object. The implication is that this is a temporary condition which will be alleviated after some  
5735 delay. If known, the length of the delay may be indicated in the message. If no delay is given, the IPP  
5736 application should handle the response as it would for a "server-error-temporary-error" response. If the  
5737 condition is more permanent, the error status codes "client-error-gone" or "client-error-not-found" could be  
5738 used.

#### 5739 13.1.5.4 server-error-version-not-supported (0x0503)

5740 The IPP object does not support, or refuses to support, the IPP protocol version that was used in the request  
5741 message supplied as the value of the "version-number" operation parameter in the request. The IPP object  
5742 is indicating that it is unable or unwilling to complete the request using the same major and minor version  
5743 number as supplied in the request other than with this error message. The error response should SHOULD  
5744 contain a Message "status-message" attribute (see section 3.1.6.2) describing why that version is not  
5745 supported and what other versions are supported by that IPP object. See section 3.1.8.

5746 ~~A conforming IPP/1.0 client MUST specify the valid version ('1.0') on each request. A conforming IPP/1.0~~  
5747 ~~object MUST NOT return this status code to a conforming IPP/1.0 client. An IPP object MUST return this~~  
5748 ~~status code to a non-conforming IPP client. The~~ The error response MUST identify in the "version-number"  
5749 operation ~~attribute~~ parameter the closest version number that the IPP object does support. For example, if a  
5750 client supplies version '1.0' and an IPP/1.1 object supports version '1.0', then it responds with version '1.0' in  
5751 all responses to such a request. If the IPP/1.1 object does not support version '1.0', then it should accept the  
5752 request and respond with version '1.1' or may reject the request and respond with this error code and version  
5753 '1.1'. If a client supplies a version '1.2', the IPP/1.1 object should accept the request and return version '1.1'  
5754 or may reject the request and respond with this error code and version '1.1'. See sections 3.1.8 and 4.4.14.

#### 5755 13.1.5.5 server-error-device-error (0x0504)

5756 A printer error, such as a paper jam, occurs while the IPP object processes a Print or Send operation. The  
5757 response contains the true Job Status (the values of the "job-state" and "job-state-reasons" attributes).  
5758 Additional information can be returned in the optional OPTIONAL "job-state-message" attribute value or in  
5759 the OPTIONAL status message that describes the error in more detail. This error status code is only

5760 returned in situations where the Printer is unable to accept the create request because of such a device error.  
5761 For example, if the Printer is unable to spool, and can only accept one job at a time, the reason it might  
5762 reject a create request is that the printer currently has a paper jam. In many cases however, where the  
5763 Printer object can accept the request even though the Printer has some error condition, the 'successful-ok'  
5764 status code will be returned. In such a case, the client would look at the returned Job Object Attributes or  
5765 later query the Printer to determine its state and state reasons.

#### 5766 13.1.5.6 server-error-temporary-error (0x0505)

5767 A temporary error such as a buffer full write error, a memory overflow (i.e. the document data exceeds the  
5768 memory of the Printer), or a disk full condition, occurs while the IPP Printer processes an operation. The  
5769 client MAY try the unmodified request again at some later point in time with an expectation that the  
5770 temporary internal error condition may have been cleared. Alternatively, as an implementation option, a  
5771 Printer object MAY delay the response until the temporary condition is cleared so that no error is returned.

#### 5772 13.1.5.7 server-error-not-accepting-jobs (0x0506)

5773 A temporary error indicating that the Printer is not currently accepting jobs, because the administrator has  
5774 set the value of the Printer's "printer-is-not-accepting-jobs" attribute to 'false' (by means outside of  
5775 ~~IPP/1.0~~the scope of this IPP/1.1 document).

#### 5776 13.1.5.8 server-error-busy (0x0507)

5777 A temporary error indicating that the Printer is too busy processing jobs and/or other requests. The client  
5778 SHOULD try the unmodified request again at some later point in time with an expectation that the  
5779 temporary busy condition will have been cleared.

#### 5780 13.1.5.9 server-error-job-canceled (0x0508)

5781 An error indicating that the job has been canceled by an operator or the system while the client was  
5782 transmitting the data to the IPP Printer. If a job-id and job-uri had been created, then they are returned in  
5783 the Print-Job, Send-Document, or Send-URI response as usual; otherwise, no job-id and job-uri are returned  
5784 in the response.

#### 5785 13.1.5.10 server-error-multiple-document-jobs-not-supported (0x0509)

5786 The IPP object does not support multiple documents per job and a client attempted to supply document data  
5787 with a second Send-Document or Send-URI operation.

5876 14. APPENDIX C: "media" keyword values

5877 Standard keyword values are taken from several sources.

5878 Standard values are defined (taken from DPA[ISO10175] and the Printer MIB[RFC1759]):

- 5879 'default': The default medium for the output device
- 5880 'iso-a4-white': Specifies the ISO A4 white medium
- 5881 'iso-a4-colored': Specifies the ISO A4 colored medium
- 5882 'iso-a4-transparent': Specifies the ISO A4 transparent medium
- 5883 'iso-a3-white': Specifies the ISO A3 white medium
- 5884 'iso-a3-colored': Specifies the ISO A3 colored medium
- 5885 'iso-a5-white': Specifies the ISO A5 white medium
- 5886 'iso-a5-colored': Specifies the ISO A5 colored medium
- 5887 'iso-b4-white': Specifies the ISO B4 white medium
- 5888 'iso-b4-colored': Specifies the ISO B4 colored medium
- 5889 'iso-b5-white': Specifies the ISO B5 white medium
- 5890 'iso-b5-colored': Specifies the ISO B5 colored medium
- 5891 'jis-b4-white': Specifies the JIS B4 white medium
- 5892 'jis-b4-colored': Specifies the JIS B4 colored medium
- 5893 'jis-b5-white': Specifies the JIS B5 white medium
- 5894 'jis-b5-colored': Specifies the JIS B5 colored medium

5895

5896 The following standard values are defined for North American media:

- 5897 'na-letter-white': Specifies the North American letter white medium
- 5898 'na-letter-colored': Specifies the North American letter colored medium
- 5899 'na-letter-transparent': Specifies the North American letter transparent medium
- 5900 'na-legal-white': Specifies the North American legal white medium
- 5901 'na-legal-colored': Specifies the North American legal colored medium

5902

5903 The following standard values are defined for envelopes:

- 5904 'iso-b4-envelope': Specifies the ISO B4 envelope medium
- 5905 'iso-b5-envelope': Specifies the ISO B5 envelope medium
- 5906 'iso-c3-envelope': Specifies the ISO C3 envelope medium
- 5907 'iso-c4-envelope': Specifies the ISO C4 envelope medium
- 5908 'iso-c5-envelope': Specifies the ISO C5 envelope medium
- 5909 'iso-c6-envelope': Specifies the ISO C6 envelope medium
- 5910 'iso-designated-long-envelope': Specifies the ISO Designated Long envelope medium
- 5911 'na-10x13-envelope': Specifies the North American 10x13 envelope medium
- 5912 'na-9x12-envelope': Specifies the North American 9x12 envelope medium

5913 'monarch-envelope': Specifies the Monarch envelope  
5914 'na-number-10-envelope': Specifies the North American number 10 business envelope medium  
5915 'na-7x9-envelope': Specifies the North American 7x9 inch envelope  
5916 'na-9x11-envelope': Specifies the North American 9x11 inch envelope  
5917 'na-10x14-envelope': Specifies the North American 10x14 inch envelope  
5918 'na-number-9-envelope': Specifies the North American number 9 business envelope  
5919 'na-6x9-envelope': Specifies the North American 6x9 inch envelope  
5920 'na-10x15-envelope': Specifies the North American 10x15 inch envelope  
5921

5922 The following standard values are defined for the less commonly used media (white-only):

5923 'executive-white': Specifies the white executive medium  
5924 'folio-white': Specifies the folio white medium  
5925 'invoice-white': Specifies the white invoice medium  
5926 'ledger-white': Specifies the white ledger medium  
5927 'quarto-white': Specified the white quarto medium  
5928 'iso-a0-white': Specifies the ISO A0 white medium  
5929 'iso-a1-white': Specifies the ISO A1 white medium  
5930 'iso-a2-white': Specifies the ISO A2 white medium  
5931 'iso-a6-white': Specifies the ISO A6 white medium  
5932 'iso-a7-white': Specifies the ISO A7 white medium  
5933 'iso-a8-white': Specifies the ISO A8 white medium  
5934 'iso-a9-white': Specifies the ISO A9 white medium  
5935 'iso-10-white': Specifies the ISO A10 white medium  
5936 'iso-b0-white': Specifies the ISO B0 white medium  
5937 'iso-b1-white': Specifies the ISO B1 white medium  
5938 'iso-b2-white': Specifies the ISO B2 white medium  
5939 'iso-b3-white': Specifies the ISO B3 white medium  
5940 'iso-b6-white': Specifies the ISO B6 white medium  
5941 'iso-b7-white': Specifies the ISO B7 white medium  
5942 'iso-b8-white': Specifies the ISO B8 white medium  
5943 'iso-b9-white': Specifies the ISO B9 white medium  
5944 'iso-b10-white': Specifies the ISO B10 white medium  
5945 'jis-b0-white': Specifies the JIS B0 white medium  
5946 'jis-b1-white': Specifies the JIS B1 white medium  
5947 'jis-b2-white': Specifies the JIS B2 white medium  
5948 'jis-b3-white': Specifies the JIS B3 white medium  
5949 'jis-b6-white': Specifies the JIS B6 white medium  
5950 'jis-b7-white': Specifies the JIS B7 white medium  
5951 'jis-b8-white': Specifies the JIS B8 white medium  
5952 'jis-b9-white': Specifies the JIS B9 white medium  
5953 'jis-b10-white': Specifies the JIS B10 white medium  
5954

5955 The following standard values are defined for engineering media (white only):

5956 '[a-white](#)': Specifies the engineering A size medium  
5957 '[b-white](#)': Specifies the engineering B size medium  
5958 '[c-white](#)': Specifies the engineering C size medium  
5959 '[d-white](#)': Specifies the engineering D size medium  
5960 '[e-white](#)': Specifies the engineering E size medium  
5961

5962 The following standard values are defined for input-trays (from ISO DPA and the Printer MIB):

5963 'top': The top input tray in the printer.  
5964 'middle': The middle input tray in the printer.  
5965 'bottom': The bottom input tray in the printer.  
5966 'envelope': The envelope input tray in the printer.  
5967 'manual': The manual feed input tray in the printer.  
5968 'large-capacity': The large capacity input tray in the printer.  
5969 'main': The main input tray  
5970 'side': The side input tray  
5971

5972 The following standard values are defined for media sizes (from ISO DPA):

5973 'iso-a0': Specifies the ISO A0 size: 841 mm by 1189 mm as defined in ISO 216  
5974 'iso-a1': Specifies the ISO A1 size: 594 mm by 841 mm as defined in ISO 216  
5975 'iso-a2': Specifies the ISO A2 size: 420 mm by 594 mm as defined in ISO 216  
5976 'iso-a3': Specifies the ISO A3 size: 297 mm by 420 mm as defined in ISO 216  
5977 'iso-a4': Specifies the ISO A4 size: 210 mm by 297 mm as defined in ISO 216  
5978 'iso-a5': Specifies the ISO A5 size: 148 mm by 210 mm as defined in ISO 216  
5979 'iso-a6': Specifies the ISO A6 size: 105 mm by 148 mm as defined in ISO 216  
5980 'iso-a7': Specifies the ISO A7 size: 74 mm by 105 mm as defined in ISO 216  
5981 'iso-a8': Specifies the ISO A8 size: 52 mm by 74 mm as defined in ISO 216  
5982 'iso-a9': Specifies the ISO A9 size: 37 mm by 52 mm as defined in ISO 216  
5983 'iso-a10': Specifies the ISO A10 size: 26 mm by 37 mm as defined in ISO 216  
5984 'iso-b0': Specifies the ISO B0 size: 1000 mm by 1414 mm as defined in ISO 216  
5985 'iso-b1': Specifies the ISO B1 size: 707 mm by 1000 mm as defined in ISO 216  
5986 'iso-b2': Specifies the ISO B2 size: 500 mm by 707 mm as defined in ISO 216  
5987 'iso-b3': Specifies the ISO B3 size: 353 mm by 500 mm as defined in ISO 216  
5988 'iso-b4': Specifies the ISO B4 size: 250 mm by 353 mm as defined in ISO 216  
5989 'iso-b5': Specifies the ISO B5 size: 176 mm by 250 mm as defined in ISO 216  
5990 'iso-b6': Specifies the ISO B6 size: 125 mm by 176 mm as defined in ISO 216  
5991 'iso-b7': Specifies the ISO B7 size: 88 mm by 125 mm as defined in ISO 216  
5992 'iso-b8': Specifies the ISO B8 size: 62 mm by 88 mm as defined in ISO 216  
5993 'iso-b9': Specifies the ISO B9 size: 44 mm by 62 mm as defined in ISO 216  
5994 'iso-b10': Specifies the ISO B10 size: 31 mm by 44 mm as defined in ISO 216  
5995 'na-letter': Specifies the North American letter size: 8.5 inches by 11 inches  
5996 'na-legal': Specifies the North American legal size: 8.5 inches by 14 inches  
5997 'executive': Specifies the executive size (7.25 X 10.5 in)

5998 'folio': Specifies the folio size (8.5 X 13 in)  
5999 'invoice': Specifies the invoice size (5.5 X 8.5 in)  
6000 'ledger': Specifies the ledger size (11 X 17 in)  
6001 'quarto': Specifies the quarto size (8.5 X 10.83 in)  
6002 'iso-c3': Specifies the ISO C3 size: 324 mm by 458 mm as defined in ISO 269  
6003 'iso-c4': Specifies the ISO C4 size: 229 mm by 324 mm as defined in ISO 269  
6004 'iso-c5': Specifies the ISO C5 size: 162 mm by 229 mm as defined in ISO 269  
6005 'iso-c6': Specifies the ISO C6 size: 114 mm by 162 mm as defined in ISO 269  
6006 'iso-designated-long': Specifies the ISO Designated Long size: 110 mm by 220 mm as defined in ISO  
6007 269  
6008 'na-10x13-envelope': Specifies the North American 10x13 size: 10 inches by 13 inches  
6009 'na-9x12-envelope': Specifies the North American 9x12 size: 9 inches by 12 inches  
6010 'na-number-10-envelope': Specifies the North American number 10 business envelope size: 4.125  
6011 inches by 9.5 inches  
6012 'na-7x9-envelope': Specifies the North American 7x9 inch envelope size  
6013 'na-9x11-envelope': Specifies the North American 9x11 inch envelope size  
6014 'na-10x14-envelope': Specifies the North American 10x14 inch envelope size  
6015 'na-number-9-envelope': Specifies the North American number 9 business envelope size  
6016 'na-6x9-envelope': Specifies the North American 6x9 envelope size  
6017 'na-10x15-envelope': Specifies the North American 10x15 envelope size  
6018 'monarch-envelope': Specifies the Monarch envelope size (3.87 x 7.5 in)  
6019 'jis-b0': Specifies the JIS B0 size: 1030mm x 1456mm  
6020 'jis-b1': Specifies the JIS B1 size: 728mm x 1030mm  
6021 'jis-b2': Specifies the JIS B2 size: 515mm x 728mm  
6022 'jis-b3': Specifies the JIS B3 size: 364mm x 515mm  
6023 'jis-b4': Specifies the JIS B4 size: 257mm x 364mm  
6024 'jis-b5': Specifies the JIS B5 size: 182mm x 257mm  
6025 'jis-b6': Specifies the JIS B6 size: 128mm x 182mm  
6026 'jis-b7': Specifies the JIS B7 size: 91mm x 128mm  
6027 'jis-b8': Specifies the JIS B8 size: 64mm x 91mm  
6028 'jis-b9': Specifies the JIS B9 size: 45mm x 64mm  
6029 'jis-b10': Specifies the JIS B10 size: 32mm x 45mm

6030 The following standard values are defined for engineering media sizes:

6031 'a': Specifies the engineering A size: 8.5 inches x 11 inches  
6032 'b': Specifies the engineering B size: 11 inches x 17 inches  
6033 'c': Specifies the engineering C size: 17 inches x 22 inches  
6034 'd': Specifies the engineering D size: 22 inches x 34 inches  
6035 'e': Specifies the engineering E size: 34 inches x 44 inches  
6036

6037 15. APPENDIX D: Processing IPP Attributes

6038 When submitting a print job to a Printer object, the IPP model allows a client to supply operation and Job  
6039 Template attributes along with the document data. These Job Template attributes in the create request  
6040 affect the rendering, production and finishing of the documents in the job. Similar types of instructions  
6041 may also be contained in the document to be printed, that is, embedded within the print data itself. In  
6042 addition, the Printer has a set of attributes that describe what rendering and finishing options which are  
6043 supported by that Printer. This model, which allows for flexibility and power, also introduces the potential  
6044 that at job submission time, these client-supplied attributes may conflict with either:

- 6045 - what the implementation is capable of realizing (i.e., what the Printer supports), as well as
- 6046 - the instructions embedded within the print data itself.

6047

6048 The following sections describe how these two types of conflicts are handled in the IPP model.

6049 15.1 Fidelity

6050 If there is a conflict between what the client requests and what a Printer object supports, the client may  
6051 request one of two possible conflict handling mechanisms:

- 6052 1) either reject the job since the job can not be processed exactly as specified, or
- 6053 2) allow the Printer to make any changes necessary to proceed with processing the Job the best it can.

6054

6055 In the first case the client is indicating to the Printer object: "Print the job exactly as specified with no  
6056 exceptions, and if that can't be done, don't even bother printing the job at all." In the second case, the client  
6057 is indicating to the Printer object: "It is more important to make sure the job is printed rather than be  
6058 processed exactly as specified; just make sure the job is printed even if client supplied attributes need to be  
6059 changed or ignored."

6060 The IPP model accounts for this situation by introducing an "ipp-attribute-fidelity" attribute.

6061 In a create request, "ipp-attribute-fidelity" is a boolean operation attribute that is OPTIONALLY supplied  
6062 by the client. The value 'true' indicates that total fidelity to client supplied Job Template attributes and  
6063 values is required. The client is requesting that the Job be printed exactly as specified, and if that is not  
6064 possible then the job MUST be rejected rather than processed incorrectly. The value 'false' indicates that a  
6065 reasonable attempt to print the Job is acceptable. If a Printer does not support some of the client supplied  
6066 Job Template attributes or values, the Printer MUST ignore them or substitute any supported value for  
6067 unsupported values, respectively. The Printer may choose to substitute the default value associated with  
6068 that attribute, or use some other supported value that is similar to the unsupported requested value. For  
6069 example, if a client supplies a "media" value of 'na-letter', the Printer may choose to substitute 'iso-a4' rather  
6070 than a default value of 'envelope'. If the client does not supply the "ipp-attribute-fidelity" attribute, the  
6071 Printer assumes a value of 'false'.

6072 Each Printer implementation MUST support both types of "fidelity" printing (that is whether the client  
6073 supplies a value of 'true' or 'false'):

- If the client supplies 'false' or does not supply the attribute, the Printer object MUST always accept the request by ignoring unsupported Job Template attributes and by substituting unsupported values of supported Job Template attributes with supported values.
- If the client supplies 'true', the Printer object MUST reject the request if the client supplies unsupported Job Template attributes.

Since a client can always query a Printer to find out exactly what is and is not supported, "ipp-attribute-fidelity" set to 'false' is useful when:

- 1) The End-User uses a command line interface to request attributes that might not be supported.
- 2) In a GUI context, if the End User expects the job might be moved to another printer and prefers a sub-optimal result to nothing at all.
- 3) The End User just wants something reasonable in lieu of nothing at all.

## 15.2 Page Description Language (PDL) Override

If there is a conflict between the value of an IPP Job Template attribute and a corresponding instruction in the document data, the value of the IPP attribute SHOULD take precedence over the document instruction. Consider the case where a previously formatted file of document data is sent to an IPP Printer. In this case, if the client supplies any attributes at job submission time, the client desires that those attributes override the embedded instructions. Consider the case were a previously formatted document has embedded in it commands to load 'iso-a4' media. However, the document is passed to an end user that only has access to a printer with 'na-letter' media loaded. That end user most likely wants to submit that document to an IPP Printer with the "media" Job Template attribute set to 'na-letter'. The job submission attribute should take precedence over the embedded PDL instruction. However, until companies that supply document data interpreters allow a way for external IPP attributes to take precedence over embedded job production instructions, a Printer might not be able to support the semantics that IPP attributes override the embedded instructions.

The IPP model accounts for this situation by introducing a "pdl-override-supported" attribute that describes the Printer objects capabilities to override instructions embedded in the PDL data stream. The value of the "pdl-override-supported" attribute is configured by means outside ~~IPP/1.0~~ the scope of this IPP/1.1 document.

This REQUIRED Printer attribute takes on the following values:

- 'attempted': This value indicates that the Printer object attempts to make the IPP attribute values take precedence over embedded instructions in the document data, however there is no guarantee.
- 'not-attempted': This value indicates that the Printer object makes no attempt to make the IPP attribute values take precedence over embedded instructions in the document data.

At job processing time, an implementation that supports the value of 'attempted' might do one of several different actions:

- 1) Generate an output device specific command sequence to realize the feature represented by the IPP attribute value.
- 2) Parse the document data itself and replace the conflicting embedded instruction with a new embedded instruction that matches the intent of the IPP attribute value.
- 3) Indicate to the Printer that external supplied attributes take precedence over embedded instructions and then pass the external IPP attribute values to the document data interpreter.
- 4) Anything else that allows for the semantics that IPP attributes override embedded document data instructions.

Since 'attempted' does not offer any type of guarantee, even though a given Printer object might not do a very "good" job of attempting to ensure that IPP attributes take a higher precedence over instructions embedded in the document data, it would still be a conforming implementation.

At job processing time, an implementation that supports the value of 'not-attempted' might do one of the following actions:

- 1) Simply pre-pend the document data with the PDL instruction that corresponds to the client-supplied PDL attribute, such that if the document data also has the same PDL instruction, it will override what the Printer object pre-pended. In other words, this implementation is using the same implementation semantics for the client-supplied IPP attributes as for the Printer object defaults.
- 2) Parse the document data and replace the conflicting embedded instruction with a new embedded instruction that approximates, but does not match, the semantic intent of the IPP attribute value.

Note: The "ipp-attribute-fidelity" attribute applies to the Printer's ability to either accept or reject other unsupported Job Template attributes. In other words, if "ipp-attribute-fidelity" is set to 'true', a Job is accepted if and only if the client supplied Job Template attributes and values are supported by the Printer. Whether these attributes actually affect the processing of the Job when the document data contains embedded instructions depends on the ability of the Printer to override the instructions embedded in the document data with the semantics of the IPP attributes. If the document data attributes can be overridden ("pdl-override-supported" set to 'attempted'), the Printer makes an attempt to use the IPP attributes when processing the Job. If the document data attributes can not be overridden ("pdl-override-supported" set to 'not-attempted'), the Printer makes no attempt to override the embedded document data instructions with the IPP attributes when processing the Job, and hence, the IPP attributes may fail to affect the Job processing and output when the corresponding instruction is embedded in the document data.

### 15.3 Using Job Template Attributes During Document Processing.

The Printer object uses some of the Job object's Job Template attributes during the processing of the document data associated with that job. These include, but are not limited to, "orientation-requested", "number-up", "sides", "media", and "copies". The processing of each document in a Job Object MUST follow the steps below. These steps are intended only to identify when and how attributes are to be used in processing document data and any alternative steps that accomplishes the same effect can be used to implement this specification document.

- 6151 1. Using the client supplied "document-format" attribute or some form of document format detection  
6152 algorithm (if the value of "document-format" is not specific enough), determine whether or not the  
6153 document data has already been formatted for printing. If the document data has been formatted,  
6154 then go to step 2. Otherwise, the document data MUST be formatted. The formatting detection  
6155 algorithm is implementation defined and is not specified by this [specification](#).  
6156 The formatting of the document data uses the "orientation-requested" attribute to determine how the  
6157 formatted print data should be placed on a print-stream page, see section 4.2.10 for the details.  
6158
- 6159 2. The document data is in the form of a print-stream in a known media type. The "page-ranges"  
6160 attribute is used to select, as specified in section 4.2.7, a sub-sequence of the pages in the print-  
6161 stream that are to be processed and images.  
6162
- 6163 3. The input to this step is a sequence of print-stream pages. This step is controlled by the "number-up"  
6164 attribute. If the value of "number-up" is N, then during the processing of the print-stream pages,  
6165 each N print-stream pages are positioned, as specified in section 4.2.9, to create a single impression.  
6166 If a given document does not have N more print-stream pages, then the completion of the  
6167 impression is controlled by the "multiple-document-handling" attribute as described in section 4.2.4;  
6168 when the value of this attribute is 'single-document' or 'single-document-new-sheet', the print-stream  
6169 pages of document data from subsequent documents is used to complete the impression.  
6170

6171 The size(scaling), position(translation) and rotation of the print-stream pages on the impression is  
6172 implementation defined. Note that during this process the print-stream pages may be rendered to a  
6173 form suitable for placing on the impression; this rendering is controlled by the values of the "printer-  
6174 resolution" and "print-quality" attributes as described in sections 4.2.12 and 4.2.13. In the case N=1,  
6175 the impression is nearly the same as the print-stream page; the differences would only be in the size,  
6176 position and rotation of the print-stream page and/or any decoration, such as a frame to the page,  
6177 that is added by the implementation.  
6178

- 6179 4. The collection of impressions is placed, in sequence, onto sides of the media sheets. This placement  
6180 is controlled by the "sides" attribute and the orientation of the print-stream page, as described in  
6181 section 4.2.8. The orientation of the print-stream pages affects the orientation of the impression; for  
6182 example, if "number-up" equals 2, then, typically, two portrait print-stream pages become one  
6183 landscape impression. Note that the placement of impressions onto media sheets is also controlled  
6184 by the "multiple-document-handling" attribute as described in section 4.2.4.  
6185
- 6186 5. The "copies" and "multiple-document-handling" attributes are used to determine how many copies of  
6187 each media instance are created and in what order. See sections 4.2.5 and 4.2.4 for the details.  
6188
- 6189 6. When the correct number of copies are created, the media instances are finished according to the  
6190 values of the "finishings" attribute as described in 4.2.6. Note that sometimes finishing operations  
6191 may require manual intervention to perform the finishing operations on the copies, especially  
6192 uncollated copies. This [document specification](#) allows any or all of the processing steps to be  
6193 performed automatically or manually at the discretion of the Printer object.

6194 16. APPENDIX E: Generic Directory Schema

6195 This section defines a generic schema for an entry in a directory service. A directory service is a means by  
6196 which service users can locate service providers. In IPP environments, this means that IPP Printers can be  
6197 registered (either automatically or with the help of an administrator) as entries of type printer in the  
6198 directory using an implementation specific mechanism such as entry attributes, entry type fields, specific  
6199 branches, etc. IPP clients can search or browse for entries of type printer. Clients use the directory service  
6200 to find entries based on naming, organizational contexts, or filtered searches on attribute values of entries.  
6201 For example, a client can find all printers in the "Local Department" context. Authentication and  
6202 authorization are also often part of a directory service so that an administrator can place limits on end users  
6203 so that they are only allowed to find entries to which they have certain access rights. IPP itself does not  
6204 require any specific directory service protocol or provider.

6205 Note: Some directory implementations allow for the notion of "aliasing". That is, one directory entry object  
6206 can appear as multiple directory entry object with different names for each object. In each case, each alias  
6207 refers to the same directory entry object which refers to a single IPP Printer object.

6208 The generic schema is a subset of IPP Printer Job Template and Printer Description attributes (sections 4.2  
6209 and 4.4). These attributes are identified as either RECOMMENDED or OPTIONAL for the directory entry  
6210 itself. This conformance labeling is NOT the same conformance labeling applied to the attributes of IPP  
6211 Printers objects. The conformance labeling in this Appendix is intended to apply to directory templates and  
6212 to IPP Printer implementations that subscribe by adding one or more entries to a directory.  
6213 RECOMMENDED attributes SHOULD be associated with each directory entry. OPTIONAL attributes  
6214 MAY be associated with the directory entry (if known or supported). In addition, all directory entry  
6215 attributes SHOULD reflect the current attribute values for the corresponding Printer object.

6216 The names of attributes in directory schema and entries SHOULD be the same as the IPP Printer attribute  
6217 names as shown.

6218 In order to bridge between the directory service and the IPP Printer object, one of the RECOMMENDED  
6219 directory entry attributes is the Printer object's "printer-uri-supported" attribute. The IPP client queries the  
6220 "printer-uri-supported" attribute in the directory entry and then addresses the IPP Printer object using one of  
6221 its URIs. The "uri-security-supported" attribute identifies the protocol (if any) used to secure a channel.

6222 The following attributes define the generic schema for directory entries of type PRINTER:

6223	printer-uri-supported	RECOMMENDED	Section 4.4.1
6224	<u>uri-authentication-supported</u>	<u>RECOMMENDED</u>	<u>Section 4.4.2</u>
6225	uri-security-supported	RECOMMENDED	Section 4.4.3
6226	printer-name	RECOMMENDED	Section 4.4.4
6227	printer-location	RECOMMENDED	Section 4.4.5
6228	printer-info	OPTIONAL	Section 4.4.6
6229	printer-more-info	OPTIONAL	Section 4.4.7
6230	printer-make-and-model	RECOMMENDED	Section 4.4.9
6231	<u>ipp-versions-supported</u>	<u>RECOMMENDED</u>	<u>Section 4.4.14</u>
6232	<u>multiple-document-jobs-supported</u>	<u>OPTIONAL</u>	<u>Section 4.4.16</u>

6233	charset-supported	OPTIONAL	Section 4.4.18
6234	generated-natural-language-supported	OPTIONAL	Section 4.4.20
6235	document-format-supported	RECOMMENDED	Section 4.4.22
6236	color-supported	RECOMMENDED	Section 4.4.26
6237	<u>compression-supported</u>	<u>RECOMMENDED</u>	<u>Section 4.4.32</u>
6238	<u>pages-per-minute</u>	<u>OPTIONAL</u>	<u>Section 4.4.36</u>
6239	<u>pages-per-minute-color</u>	<u>OPTIONAL</u>	<u>Section 4.4.37</u>
6240	finishings-supported	OPTIONAL	Section 4.2.6
6241	number-up-supported	OPTIONAL	Section 4.2.7
6242	sides-supported	RECOMMENDED	Section 4.2.8
6243	media-supported	RECOMMENDED	Section 4.2.11
6244	printer-resolution-supported	OPTIONAL	Section 4.2.12
6245	print-quality-supported	OPTIONAL	Section 4.2.13
6246			
6247			

6248

6249 18-17. APPENDIX F: Change History for the IPP Model and Semantics document  
6250 Differences between the IPP/1.0 and IPP/1.1 "Model and Semantics" Documents

6251 The following substantive changes and major clarifications have been made to this document from the June  
6252 30, 1998 version based on the interoperability testing that took place September 23-25 1998 and subsequent  
6253 mailing list and meeting discussions. They are listed in the order of occurrence in the document. These  
6254 changes are the ones that might affect implementations. Clarifications that are unlikely to affect  
6255 implementations are not listed. The issue numbers refer to the IPP Issues List which is available in the  
6256 following directory:

6257

6258

6259

6260

<ftp://ftp.pwg.org/pub/pwg/ipp/approved-clarifications/>

Section	Description
global	Replaced TLS references with SSL3 references as agreed with our Area Director on 11/12/1998.
global	Removed the indications that some of these IPP documents are informational, since the intent is now to publish all IPP/1.0 documents as informational as agreed with our Area Director on 11/12/1998.
3.1.2, 16.3.3 {now IPP-HG}	Clarify that the IPP object SHOULD NOT validate the range of the request-id being 1 to 2**31-1, but accepts and returns any value. Clients MUST still keep in the range 1 to 2**31 though. If the request is terminated before the complete "request-id" is received, the IPP object rejects the request and returns a response with a "request-id" of 0 (Issue 1.36).
3.1.4.1, 14.1.4.14	Clarified that when a client submits a request in a charset that is not supported, the IPP object SHOULD return any 'text' or 'name' attributes in the 'utf-8' charset, if it returns any, since clients and IPP objects MUST support 'utf-8'. (Issue 1.19)
3.1.4.1	Clarified Section 3.1.4.1 Request Operation Attributes that a client MAY use the attribute level natural language override (text/nameWithLanguage) redundantly in a request. (Issue 1.46)
3.1.4.2	Clarified Section 3.1.4.2 Response Operation Attributes that an IPP object MAY use the attribute level natural language override (text/nameWithLanguage) redundantly in a response. (Issue 1.46)
3.1.6	Clarified section 3.1.6: If the Printer object supports the "status-message" operation attribute, it NEED NOT return a status message for the following error status codes: 'client-error-bad-request', 'client-error-charset-not-supported', 'server-error-internal-error', 'server-error-operation-not-supported', and 'server-error-version-not-supported'.
3.2.1.1	Clarified that if a client is not supplying any Job Template attributes in a request, the client SHOULD omit Group 2 rather than sending an empty

	group. However, a Printer object MUST be able to accept an empty group. This makes [IPP-MOD] agree with [IPP-PRO]. (Issue 1.16)
3.2.1.2, 3.2.5.2, 3.2.6.2, 3.3.1.2, 3.3.3.2, 3.3.4.2,	Clarified that if an IPP object is not returning any Unsupported Attributes in a response, the IPP object SHOULD omit Group 2 rather than sending an empty group. However, a client MUST be able to accept an empty group. This makes [IPP-MOD] agree with [IPP-PRO]. (Issue 1.17)
3.2.1.2, 14.1.2.2, 14.1.4.12	Clarified that an IPP object MUST treat an unsupported attribute syntax supplied in a request in the same way as an unsupported value. The IPP object MUST return the attribute, the attribute syntax, and the value in the Unsupported Attributes group. (Issue 1.26)
3.2.5.2, 3.2.6.2, 3.3.4.2, 14.1.2.1, 14.1.2.2, 14.1.4.12	Clarified for Get-Printer-Attributes, Get-Jobs, and Get-Job-Attributes that an IPP object MUST return 'successful-ok-ignored-or-substituted-attributes' (0x1), rather than 'successful-ok' (0x0), when a client supplies unsupported attributes as values of the 'requested-attributes' operation attribute. (Issue 1.24) Also clarified that the response NEED NOT contain the "requested-attributes" operation attribute with any supplied values (attribute keywords) that were requested by the client but are not supported by the IPP object. (Issue 1.18)
3.2.6.2 4.1.1.2 4.3.24	Deleted the job-level natural language override (NLO) from Section 3.2.6.2 Get-Jobs Response so that all operation responses are the same with respect to NLO. (Issue 1.47)
3.3.1	Clarified that an IPP Printer that supports the Create-Job operation MUST handle the situation when a client does not supply Send-Document or Send-URI operations within a one- to four-minute time period. Also clarified that a client MUST send documents in a multi-document job without undue or unbounded delay. (Issue 1.28)
3.3.3	Clarified that the IPP object MUST reject a Cancel-Job request if the job is in 'completed', 'canceled', or 'aborted' job states. (Issue 1.12)
4.1.2.3	Added this new sub-section: it specifies that nameWithoutLanguage plus the implicit natural language matches nameWithLanguage, if the values and natural languages are the same. Also added that keyword never matches nameWithLanguage or nameWithoutLanguage. Clarified that if both have countries, that the countries SHOULD match as well. If either do not, then the country field SHOULD be ignored. (Issues 1.33 and 1.34)
4.1.5	Clarified regarding the case-insensitivity of URLs to refer only to the RFCs that define them. (Issue 1.10)
4.1.11	Clarified that 'boolean' is not a full-sized integer. (Issue 1.38)
4.1.15	Clarified that 'resolution' is not three full-sized integers. (Issue 1.20)
4.2.*	Clarified that standard values are keywords or enums, not names. (Issue 1.49).
4.2.4	Added the 'single-document new-sheet' value to Section 4.2.4 multiple-

	<del>document handling. (Issue 1.54)</del>
<del>4.4.18, 4.4.19</del>	<del>Clarified that the "document-format-default" and "document-format-supported" Printer Description attributes are REQUIRED to agree with the table. (Issue 1.4)</del>
<del>4.4.21</del>	<del>Changed "queued-job-count" from OPTIONAL to RECOMMENDED. (Issue 1.14)</del>
<del>4.4.28</del>	<del>Clarified that the implementation-supplied value for the "multiple-operation-time-out" attribute SHOULD be between 30 and 240 seconds, though the implementation MAY allow the administrator to set values, and MAY allow values outside this range. (Issue 1.28)</del>
<del>5.1, 5.2.5</del>	<del>Clarified Client Conformance that if a client supports an attribute of 'text' attribute syntax, that it MUST support both the textWithoutLanguage and the textWithLanguage forms. Same for 'name' attribute syntax. Same for an IPP object (Issue 1.48)</del>
<del>6.5, 12.8</del>	<del>Added new section to allow Attribute Groups to be registered as extensions for being passed in operation requests and responses. (Issue 1.25)</del>
<del>7.</del>	<del>Updated the table of text and name attributes to agree with Section 4.2.</del>
<del>8.5</del>	<del>Added a new section RECOMMENDING that the Get Jobs SHOULD return non-IPP jobs whether or not assigning them a job-id and job-uri. Also RECOMMENDED generating, if possible, job-id and job-uri and supporting other IPP operations on foreign jobs as an implementer option. (Issue 1.32)</del>
<del>9.</del>	<del>Updated document references.</del>
<del>14.1.4.14</del>	<del>Clarified 'client-error-charset-not-supported' that 'utf-8' must be used for any 'text' or 'name' attributes returned in the error response (Issue 1.19).</del>
<del>14.1.5.9</del>	<del>Added a new error code 'server-error-job-canceled' (0x0508) to be returned if a job is canceled by another client or aborted by the IPP object while the first client is still sending the document data. (Issue 1.29)</del>
<del>16.3, 16.4</del>	<del>Moved these sections recommending operation processing steps to the new Implementer's Guide (informational). There indicated that all of the error checks are not required, so an IPP object MAY be forgiving and accept non-conforming requests. However, a conforming client MUST supply requests that would pass all of the error checks indicated. (Issue 1.21)</del>
<del>17</del>	<del>Changed directory schema attributes from REQUIRED to RECOMMENDED. Changed some of the OPTIONAL to RECOMMENDED to agree with the SLP template. Changed the "charset-supported" and "natural-language-supported" from REQUIRED to OPTIONAL. Recommended that the names be the same in a directory entry as the IPP attribute names. (Issue 1.53)</del>

6261  
6262  
6263  
6264

This Appendix is divided into two lists that summarize the differences between IPP/1.1 (this document) and IPP/1.0 [RFC2566]. The section numbers refer to the numbers in this document which in some cases have changed from RFC 2566. When a change affects multiple sections, the item is listed once in the order of the first section affected and the remaining affected section numbers are indicated.

The first list contains extensions and clarifications and the second list contains changes in semantics or conformance. However, client and IPP object implementations of IPP/1.0 may implement any of the extensions and clarifications in this document.

The following extensions and clarifications have been incorporated into this document:

1. Section 2.1 - clarified that the term "client" can be either contained in software controlled by an end user or a part of a print server that controls devices.
2. Section 2 - clarified that the term "IPP object" and "Printer object" can either be embedded in a device object or part of a print server that accepts IPP requests.
3. Section 2.4 - added the description of the new "uri-authentication-supported" Printer Description attribute.
4. Section 3.1.3, 3.1.6, 3.2.5.2, and 3.2.6.2 - clarified the error handling for operation attributes that have their own status code.
5. Section 3.1.6 - reorganized this section into sub-sections to separately describe "status-code", "status-message", "detailed-status-message", and "document-access-error" attributes.
6. Section 3.1.6.1 - clarified the error status codes and their relationship to operation attributes.
7. Section 3.1.6.3 - Added the OPTIONAL "detailed-status-message (text(MAX))" operation attribute to provide additional more detailed information about a response.
8. Section 3.1.6.4 and 3.2.2 - Added the OPTIONAL "document-access-error (text(MAX))" operation attribute for use with Print-URI and Send-URI responses.
9. Sections 3.1.7 - Added this new section to clarify returning Unsupported Attributes for all operations, including only returning attributes that were in the request. Moved the text from section 3.2.1.2 Unsupported Attributes to this section.
10. Sections 3.1.7 and 4.1 - clarified the encoding of the "out-of-band" 'unsupported' and 'unknown' values.
11. Section 3.1.8 - clarified that only the version number parameter will be carried forward into future major or minor versions of the protocol.
12. Section 3.1.8 - relaxed the requirements to increment the major version number in future versions of the Model and Semantics document.
13. Section 3.1.9, and 3.2.5 - added the 'processing' state to the list of job states that a job can be in after a Create-Job operation.
14. Section 3.1.9 - clarified that a non-spooling Printer MAY accept zero or more subsequent jobs while processing a job and flow control them down. Subsequent create requests are rejected with the 'server-error-busy' error status.
15. Section 3.2.1.1 - clarified the validation of the "compression" operation attribute and its relationship to the validation of the "document-format" attribute and returning Unsupported Attributes.
16. Sections 3.2.1.1, 4.3.8, 13.1.4.16, and 13.1.4.17 - added the 'client-error-compression-not-supported', 'client-error-compression-error' status codes and the 'unsupported-compression' and 'compression-error' job-state-reasons.
17. Sections 3.2.1.1 and 4.3.8 - added 'unsupported-document-format' and 'document-format-error' job-state-reasons.
18. Sections 3.2.2, 4.3.8 and 13.1.4.19 - added 'client-error-document-access-error' status code and 'document-access-error' job state reason.
19. Section 3.2.5.2 and 3.2.6.2 - clarified that the Unsupported Attributes group MUST NOT include attributes not requested in the Get-Printer-Attributes request.

- 6309 20. Section 3.2.6 - clarified that "limit" takes precedence over "which-jobs" and "my-jobs".  
6310 21. Section 3.2.6.2 - clarified that Get-Jobs returns 'successful-ok' when no jobs to return.  
6311 22. Sections 3.2.7, 3.2.8, and 3.2.9 - added the OPTIONAL Pause-Printer, Resume-Printer, and Purge-  
6312 Jobs operations  
6313 23. Section 3.3.1 - clarified that the authorization required for a Send-Document request MUST be the  
6314 same user as the Create-Job or an operator.  
6315 24. Sections 3.3.5, 3.3.6, and 3.3.7 - added the OPTIONAL Hold-Job, Release-Job, and Restart-Job  
6316 operations.  
6317 25. Section 4.1 - clarified that the encoding of the out-of-band values are specified in the Encoding and  
6318 Transport" document.  
6319 26. Section 4.1.9.1 - clarified that 'application/octet-stream' auto-sensing can happen at create request  
6320 time and/or job/document processing time.  
6321 27. Section 4.1.14 - clarified that the localization of dateTime by the client includes the time zone.  
6322 28. Section 4.2 - clarified that xxx-supported have multiple keywords and/or names by adding  
6323 parentheses to the table to give: (1setOf (type3 keyword | name))  
6324 29. Section 4.2.2 - added the 'indefinite' keyword value to the "job-hold-until" attribute for use with the  
6325 create operations and Hold-Job and Restart-Job operations.  
6326 30. Section 4.2.6 - added more enum values to the "finishings" Job Template attribute.  
6327 31. Section 4.3.7 - added that a forwarding server that cannot get any job state MAY return the job's  
6328 state as 'completed', provided that it also return the new 'queued-in-device' job state reason.  
6329 32. Section 4.3.7.2 - added the Partitioning of Job States section to clarify the concepts of Job  
6330 Retention, Job History, and Job Removal.  
6331 33. Section 4.3.8 - added 'job-data-insufficient' job state reason to indicate whether sufficient data has  
6332 arrived for the document to start to be processed.  
6333 34. Section 4.3.8 - added 'document-access-error' job state reason to indicate an access error of any kind.  
6334 35. Section 4.3.8 - added 'job-queued-for-marker' job state reason to indicate whether the job has  
6335 completed some processing and is waiting for the marker.  
6336 36. Section 4.3.8 - added 'unsupported-compression' and 'compression-error' job state reasons to  
6337 indicate compression not supported or compression processing error after the create has been  
6338 accepted.  
6339 37. Section 4.3.8 - added 'unsupported-document-format' and 'document-format-error' job state reasons  
6340 to indicate document not supported or document format processing error after the create has been  
6341 accepted.  
6342 38. Section 4.3.8 - added 'queued-in-device' job state reason to indicate that a job as been forwarded to a  
6343 print system or device that does not provide any job status.  
6344 39. Section 4.3.10 - added "job-detailed-status-messages (1setOf text(MAX)) for returning detailed  
6345 error messages.  
6346 40. Section 4.3.11 - added the "job-document-access-errors (1setOf text(MAX))  
6347 41. Section 4.3.14.2 - clarified that the time recorded is the first time processing since the create  
6348 operation or the Restart-Job operation.  
6349 42. Section 4.3.14.2 and 4.3.14.3 - clarified that the out-of-band value 'no-value' is returned if the job  
6350 has not started processing or has not completed, respectively.  
6351 43. Section 4.3.14 - Added the OPTIONAL "date-time-at-creation", "date-time-at-processing", and  
6352 "date-time-at-completed" Event Time Job Description attributes  
6353 44. Section 4.4.3 - added the 'tls' value to "uri-security-supported" attribute.

- 6354 45. Section 4.4.3 - clarified "uri-security-supported" is orthogonal to Client Authentication so that 'none'  
6355 does not exclude Client Authentication.
- 6356 46. Section 4.4.11 - simplified the "printer-state" descriptions while generalizing to allow high end  
6357 devices that interpret one or more jobs while marking another. Indicated that 'spool-area-full' and  
6358 'stopped-partly' "printer-state-reasons" may be used to provide further state information.
- 6359 47. Section 4.4.12 - added the 'moving-to-paused' keyword value to the "printer-state-reasons" attribute  
6360 for use with the Pause-Job operation.
- 6361 48. Section 4.4.12 - replaced the duplicate 'marker-supply-low' keyword with the missing 'toner-empty'  
6362 keyword for the "printer-state-reasons" attribute. (This correction was also made before RFC 2566  
6363 was published).
- 6364 49. Section 4.4.12 - clarified 'spool-area-full' "printer-state-reasons" to include non-spooling printers to  
6365 indicate when it can and cannot accept another job.
- 6366 50. Section 4.4.15 - added the enum values to the "operations-supported" attribute for the new  
6367 operations. Clarified that the values of this attribute are encoded as any enum, namely 32-bit values.
- 6368 51. Section 4.4.30 - clarified that the dateTime value of "printer-current-time" is on a "best efforts  
6369 basis". If a proper date-time cannot be obtained, the implementation returns the 'no-value' out-of-  
6370 band value. Also clarified that the time zone NEED NOT be the time zone that the people near the  
6371 device use and that the client SHOULD display the dateTime attributes in the user's local time.
- 6372 52. Sections 4.4.36 and 4.4.37 - added the OPTIONAL "pages-per-minute" and "pages-per-minute-  
6373 color" Printer Description attributes.
- 6374 53. Section 5.1 - clarified that the client conformance requirements apply to clients controlled by an end  
6375 user and clients in servers.
- 6376 54. Section 5.1 - clarified that any response MAY contain additional attribute groups, attributes,  
6377 attribute syntaxes, or attribute values.
- 6378 55. Section 5.1 - clarified that a client SHOULD do its best to prevent a channel from being closed by a  
6379 lower layer when the channel is flow controlled off by the IPP Printer.
- 6380 56. Section 5.2 - clarified that the IPP object requirements apply to objects embedded in devices or that  
6381 are parts of servers.
- 6382 57. Section 0 - clarified that IPP objects MAY return operation responses that contain attribute groups,  
6383 attribute names, attribute syntaxes, attribute values, and status codes that are extensions to this  
6384 standard.
- 6385 58. Section 1.1 - clarified the use of URIs for each Client Authentication mechanism.
- 6386 59. Section 8.5 - added the security discussion around the new operator/administrator operations.
- 6387 60. Section 13.1.4.16 - added client-error-compression-not-supported (0x040F)
- 6388 61. Section 13.1.4.17 - added client-error-compression-error (0x0410)
- 6389 62. Section 13.1.4.18 - added client-error-document-format-error (0x0411)
- 6390 63. Section 13.1.4.19 - added client-error-document-access-error (0x0412)
- 6391 64. Section 13.1.5.10 - added server-error-multiple-document-jobs-not-supported (0x0509)
- 6392 65. Section 14 - added 'a-white', 'b-white', 'c-white', 'd-white', and 'e-white' and clarified that the existing  
6393 'a', 'b', 'c', 'd', and 'e' values are size values.
- 6394 66. Section 16 - added the OPTIONAL "pages-per-minute" and "pages-per-minute-color" Printer  
6395 attributes to the Directory schema.
- 6396 67. Section 16 - added OPTIONAL "multiple-document-jobs-supported" to the Directory schema.
- 6397 68. Section 16 - added RECOMMENDED "uri-authentication-supported", "ipp-versions-supported",  
6398 and "compression-supported" to the Directory schema.

The following changes in semantics and/or conformance have been incorporated into this document:

1. Section 3.1.8, 5.2.4, and 13.1.5.4 - Clients and IPP objects MUST support version 1.1 conformance requirements. It is recommended that they interoperate with 1.0. Also clarified that IPP Printers MUST accept '1.1' requests. It is recommended that they also accept '1.x' requests.
2. Section 3.2.1.1 and section 4.4.32 - changed the "compression" operation and the "compression-supported" Printer Description attribute from OPTIONAL to REQUIRED.
3. Sections 3.2.1.2 and 4.3.8 - changed "job-state-reasons" from RECOMMENDED to REQUIRED, so that "job-state-reasons" MUST be returned in create operation responses.
4. Sections 3.2.4, 3.3.1, 4.4.16, and 16 - changed Create-Job/Send-Document so that they MAY be implemented while only supporting one document jobs. Added the "multiple-document-jobs-supported" boolean Printer Description attribute to indicate whether Create-Job/Send-Document support multiple document jobs or not. Added to the Directory schema.
5. Section 4.1.9 - deleted 'text/plain; charset=iso-10646-ucs-2', since binary is not legal with the 'text' type.
6. Section 4.2.4 - indicated that the "multiple-document-handling" Job Template attribute MUST be supported with at least one value if the Printer supports multiple documents per job
7. Section 4.3.7.2 - indicated that the 'job-restartable' job state reason SHOULD be supported if the Restart-Job operation is supported.
8. Section 4.3.8 - changed "job-state-reasons" from RECOMMENDED to REQUIRED.
9. Section 4.3.8 - clarified the conformance of the values of the "job-state-reasons" attribute by copying conformance requirements from other sections of the document so that it is clear from reading the definition of "job-state-reasons" which values MUST or SHOULD be supported. The 'none', 'unsupported-compression', and 'unsupported-document-format' values MUST be supported. The "job-hold-until-specified" SHOULD be specified if the "job-hold-until" Job Template is supported. The following values SHOULD be supported: 'job-canceled-by-user', 'aborted-by-system', and 'job-completed-successfully'. The 'job-canceled-by-operator' SHOULD be supported if the implementation permits canceling by other than the job owner. The 'job-canceled-at-device' SHOULD be supported if the device supports canceling jobs at the console. The 'job-completed-with-warnings' SHOULD be supported, if the implementation detects warnings. The 'job-completed-with-errors' SHOULD be supported if the implementation detects errors. The 'job-restartable' SHOULD be supported if the Restart-Job operation is supported.
10. Section 4.3.14 - changed the "time-at-creation", "time-at-processing", and "time-at-completed" Event Time Job Description attributes from OPTIONAL to REQUIRED.
11. Section 4.3.14.4 - added the REQUIRED "job-printer-up-time (integer(1:MAX))" Job Description attribute as an alias for "printer-up-time" to reduce number of operations to get job times.
12. Section 4.4.2 - added the REQUIRED "uri-authentication-supported (1setOf type2 keyword)" Printer Description attribute to describe the Client Authentication used by each Printer URI.
13. Section 4.4.12 - changed "printer-state-reasons" Printer Description attribute from OPTIONAL to REQUIRED.
14. Section 4.4.12 - changed 'paused' value of "printer-state-reasons" to MUST if Pause-Printer operation is supported.

- 6442 15. Section 4.4.14 - added the REQUIRED "ipp-versions-supported (1setOf keyword)" Printer  
6443 Description attribute, since IPP/1.1 Printers do not have to support version '1.0' conformance  
6444 requirements. Section 4.4.16 - added the "multiple-document-jobs-supported (boolean)" Printer  
6445 Description attribute so that a client can tell whether a Printer that supports Create-Job/Send-  
6446 Document supports multiple document jobs or not. This attribute is REQUIRED if the Create-  
6447 Job operation is supported.
- 6448 16. Section 4.4.24 - changed the "queued-job-count" Printer Description attribute from  
6449 RECOMMENDED to REQUIRED.
- 6450 17. Section 4.4.32 - changed "compression-supported (1setOf type3 keyword)" Printer Description  
6451 attribute from OPTIONAL to REQUIRED.
- 6452 18. Section 5.1 - changed the client security requirements from RECOMMENDED non-standards  
6453 track SSL3 to MUST support Client Authentication as defined in the IPP/1.1 Encoding and  
6454 Transport document [IPP-PRO]. A client SHOULD support Operation Privacy and Server  
6455 Authentication as defined in the IPP/1.1 Encoding and Transport document [IPP-PRO].
- 6456 19. Section 5.2.7 - changed the IPP object security requirements from OPTIONAL non-standards track  
6457 SSL3 to SHOULD contain support for Client Authentication as defined in the IPP/1.1 Encoding  
6458 and Transport document [IPP-PRO]. A Printer implementation MAY allow an administrator to  
6459 configure the Printer so that all, some, or none of the users are authenticated. An IPP Printer  
6460 implementation SHOULD contain support for Operation Privacy and Server Authentication as  
6461 defined in the IPP/1.1 Encoding and Transport document [IPP-PRO]. A Printer implementation  
6462 MAY allow an administrator to configure the degree of support for Operation Privacy and  
6463 Server Authentication. Security MUST NOT be compromised when the client supplies a lower  
6464 version-number in a request.

6465 See also the "IPP/1.1 Encoding and Transport" [IPP-PRO] document for differences between IPP/1.0  
6466 [RFC2565] and IPP/1.1 [IPP-PRO].
